Hi Cary and Ray,

For the restoration projects we are doing on the Satsop and Wynoochee we need a better grasp on the type and timing of river users (for the risk analysis portion of the design). We need a bit of info related to boaters/fishers such as timing of fishing and typical boat type.

Thanks for your help and let me know if you have any questions,  
-Anthony

Hey Anthony

Fishing enthusiasts will be on the Wynoochee from June till September for summer steelhead and then December until April for winter steelhead  
Satsop will see most pressure from October until December for salmon and then January until April for winter steelhead.  
Drift boat and sled operators on both systems.

As I recall most in stream structures will be utilized by the river only during high water events, greater than 2500cfs on both systems is what most people consider high or borderline unfishable. So assuming this most structures won't have a huge impact on safety.

Let me know if we can provide more information

Cary
