The QA goal is a difference <2 times the detection limit instead of the number indicated in the goal column. [2] Pre-extraction holding time. [3] Goal applies to surrogate standard. [4] The criterion are analyte specific; the goal shows the minimum and maximum ranges for analytes.

NA – not applicable or not available; NC – not calculable due to one or more values below the detection limit; NS – field duplicate not sampled; NR – not reported; SURR – Surrogate standard
