# Introduction

The Redmond Paired Watershed Study (RPWS) is one of several effectiveness monitoring studies that was selected for implementation starting in 2014 for the Stormwater Action Monitoring (SAM) program for Puget Sound. The goal of effectiveness monitoring under the SAM program is to provide widely applicable information for improving stormwater management in the region. Phase I and Phase II Municipal Stormwater Permittees in the Puget Sound Region contribute to a Pooled Stormwater Resources Fund that supports the SAM program and associated effectiveness monitoring studies. Selection of the RPWS for implementation under the SAM program was made based on a monitoring proposal that was presented to permittee representatives at workshops that were held on March 20, 2014, and May 6, 2014. The specific study question to be addressed through the RPWS is as follows:

> ***How effective are watershed rehabilitation efforts at improving receiving water conditions at the watershed scale?***

To address this study question, a conceptual experimental design for the RPWS was subsequently developed and summarized in the *Redmond Paired Watershed Study Experimental Design Report* (Herrera 2015a). This conceptual experimental design was informed by a literature review (Herrera 2015b) that was conducted to identify lessons learned from past studies that have been implemented to achieve similar objectives. The conceptual experimental design was also developed based on input from a technical advisory committee (TAC) that was formed for the study. This TAC currently includes representation from the following jurisdictions and agencies:

City of Redmond

City of Kirkland

City of Seattle

City of Tacoma

King County

US Geological Survey

Washington State Department of Ecology (Ecology)

Building on this previous work, a Quality Assurance Project Plan (QAPP) was developed to guide the implementation of all subsequent phases of the RPWS (Herrera 2015c). This QAPP documents the experimental design and procedures that will be used during data collection, processing, and analysis to ensure all results obtained for the RPWS are scientifically defensible.

Monitoring pursuant to this QAPP initiated in 2016 and is anticipated to continue for a 10-year time frame. Data summary reports are being prepared on an annual basis over this period to summarize compiled monitoring data collected through each of the major components of the RPWS. These reports also document any quality assurance issues associated with these data and resultant limitations (if any) on their use or interpretation. Finally, these reports document all rehabilitation efforts that have been implemented by the City of Redmond (City) or King County (County) over the previous year. Included is detailed information on the design and operational status of structural stormwater controls and the frequency and geographic extent of nonstructural stormwater control implementation. Each annual data summary report documents this information based on monitoring that was conducted over the previous water year (i.e., October through September). Data summary reports (Herrera 2017, 2018, 2019, 2020a, 2021a, 2023a, 2023b) were prepared previously for data collected over water year (WY) 2016 through WY2022.

In years 4, 8, and 10 of the RPWS' implementation, trend analyses reports are also being prepared as companion documents to the data summary reports described above (note WY2023 represents year 8 of the RPWS' implementation). These reports summarize the results of statistical analyses that are performed on the compiled data from all previous years of monitoring to detect potential relationships between rehabilitation efforts and improved receiving water conditions. Each report also presents major conclusions from these analyses. A trend analysis report (Herrera 2020b) was prepared following year 4 of the RPWS' implementation.

This document represents the data summary report for monitoring that occurred over WY2023 for the RPWS. It is organized to include the following sections:

- Background: An explanation of why the project is needed.
- Experimental Design: The sampling process design for the study, including sample types, monitoring locations, and sampling frequency.
- Monitoring Procedures: A description of any major deviations from the monitoring procedures that were identified in the QAPP for the study (Herrera 2015c).
- Rehabilitation Effort Summary: A description of all watershed rehabilitation efforts that were implemented by the City or County over WY2023 and previous water years.
- Monitoring Results Summary: A summary of compiled monitoring data collected through each of the major components of the study.

# Background

Municipal Stormwater Permits are issued by Ecology to regulate discharges from separated storm sewers owned or operated by Phase I and Phase II cities and counties. The Municipal Stormwater Permits establish the minimum requirements for permittees to address existing and future impacts to receiving waters from urbanization. Municipal Stormwater Permits require cities and counties to execute programmatic (nonstructural) activities and establish design standards for stormwater structural controls triggered by development and redevelopment (onsite stormwater management, runoff treatment, and flow control facilities). Ideally, if all developed land in a watershed is equipped with nonstructural and structural stormwater controls, the receiving water would be protected from hydrologic and water quality impacts caused by urbanization. However, while the effectiveness of nonstructural and structural controls has been well documented at the site and parcel scale, limited data exists on the effectiveness of these controls in aggregate for improving conditions in receiving waters at the watershed scale (Herrera 2015b).

In February 2014, Ecology expressed their support for a Citywide Watershed Management Plan (WMP) (Herrera 2013) that coordinates stormwater management efforts from the Municipal Stormwater Permit, Section 303(d) of the Clean Water Act, and salmon recovery to allow use of a watershed approach for improving receiving water conditions. Through the implementation of this WMP, the City will focus stormwater best management practices (BMPs) in a subset of priority watersheds that are moderately impacted by urbanization and therefore expected to respond more quickly to rehabilitation efforts. This provides a unique opportunity to study the effectiveness of stormwater BMPs for improving receiving water conditions on an accelerated time frame and at a watershed scale. Recognizing this opportunity, the City is implementing the RPWS to quantify improvements in receiving water conditions with support from the SAM program.

# Experimental Design

As described in the Introduction to this report, the specific study question to be addressed through the RPWS is as follows:

> *How effective are watershed rehabilitation efforts at improving receiving water conditions at the watershed scale?*

In this context, rehabilitation efforts could include any of the following practices:

- Stormwater management retrofits in upland areas that could include facilities for onsite stormwater management (e.g., low impact development [LID] practices, runoff treatment, and flow control)
- Onsite stormwater management facilities required due to Municipal Stormwater Permit requirements for development and redevelopment
- Riparian and in-stream habitat improvements
- Programmatic practices for stormwater management

To answer the study question identified above, the experimental design for the RPWS has two primary components:

- Status and Trends Monitoring: Routine and continuous measurements of various hydrologic, chemical, physical habitat, and biological indicators of stream health over an extended time frame to quantify improvements in receiving water conditions in response to watershed rehabilitation efforts.
- Effectiveness Monitoring: Measurements of hydrologic and chemical parameters over a relatively short time frame to document the effectiveness of specific structural stormwater controls that have been constructed to improve receiving water conditions.

The Status and Trends Monitoring utilizes a "paired watershed" experimental design that involves collecting these measurements in seven watersheds categorized as follows:

- Three "Application" watersheds with wadeable lowland streams that are moderately impacted by urbanization and prioritized for rehabilitation efforts.
- Two "Reference" watersheds with relatively pristine wadeable lowland streams that do not require rehabilitation.
- Two "Control" watersheds with wadeable lowland streams that are significantly impacted by urbanization and not currently prioritized for rehabilitation.

Table 1 identifies the name, predominant land use/cover, and size of each watershed; the location of all the watersheds is shown in Figure 1. A detailed summary of conditions within each watershed is also provided in the QAPP that was prepared for the study (Herrera 2015c) with information on planned rehabilitation efforts in the Application watersheds as applicable.

**Table 1. Application, Reference, and Control Watersheds for the Redmond Paired Watershed Study.**

| Watershed Name | Watershed Type | Dominant Land Use/Cover | Watershed Total Area (acres) | Watershed Area Inside Redmond (acres) |
|---|---|---|---|---|
| Evans Creek Tributary 108 | Application | Residential | 397 | 0[a] |
| Monticello Creek | Application | Residential/Commercial | 345 | 264 |
| Tosh Creek | Application | Residential/Commercial | 299 | 276 |
| Colin Creek[a] | Reference | Forest | 1,990 | 90 |
| Seidel Creek[a] | Reference | Forest | 1,188 | 615 |
| Country Creek | Control | Residential/Commercial | 212 | 212 |
| Tyler's Creek | Control | Residential/Commercial | 168 | 167 |

[a] Watershed is in unincorporated King County.

Fixed monitoring stations were established in each watershed for monitoring various indicators of stream health. Due to the scale of the RPWS and the anticipated lag between applying stormwater controls and resultant improvements in receiving water conditions, quantifying a cause and effect relationship between these events may take many years. Therefore, monitoring at the fixed monitoring stations will occur over an anticipated 10-year time frame. Furthermore, because the effectiveness of watershed rehabilitation practices (e.g., stormwater retrofits, instream habitat improvements, and programmatic practices) may vary for different types of receiving water impairments, a broad suite of indicators for assessing potential improvements are being monitored within the following categories: hydrologic, water quality, physical habitat, sediment quality, and biological. The pattern of interest will be evidence that receiving water conditions are improving based on one or more of these indicators in the Application watersheds while conditions in the Reference and Control watersheds remain relatively static.

The following subsections provide more detailed information on the Status and Trends Monitoring and Effectiveness Monitoring, respectively, as originally defined in the QAPP that was prepared for the study (Herrera 2015c) including the monitoring stations, measurement frequency, indicators, and data analysis methods where applicable. Deviations from these monitoring procedures that took place in WY2023 are noted in a subsequent section.

# Status and Trends Monitoring

This section describes the monitoring stations, measurement frequency, indicators, and data analysis methods that will be used for the Status and Trends Monitoring component of the RPWS. This information is organized under separate subsections for the following monitoring categories: hydrologic, water quality, physical habitat, sediment quality, and biological. The specific indicators of stream health that are evaluated in these categories are also summarized in Table 2 with their associated measurement frequency. Note significant changes to the experimental design for the Status and Trends Monitoring were made in WY2023 relative to the original QAPP. These changes are described in detail in the Monitoring Procedures section (page 29).

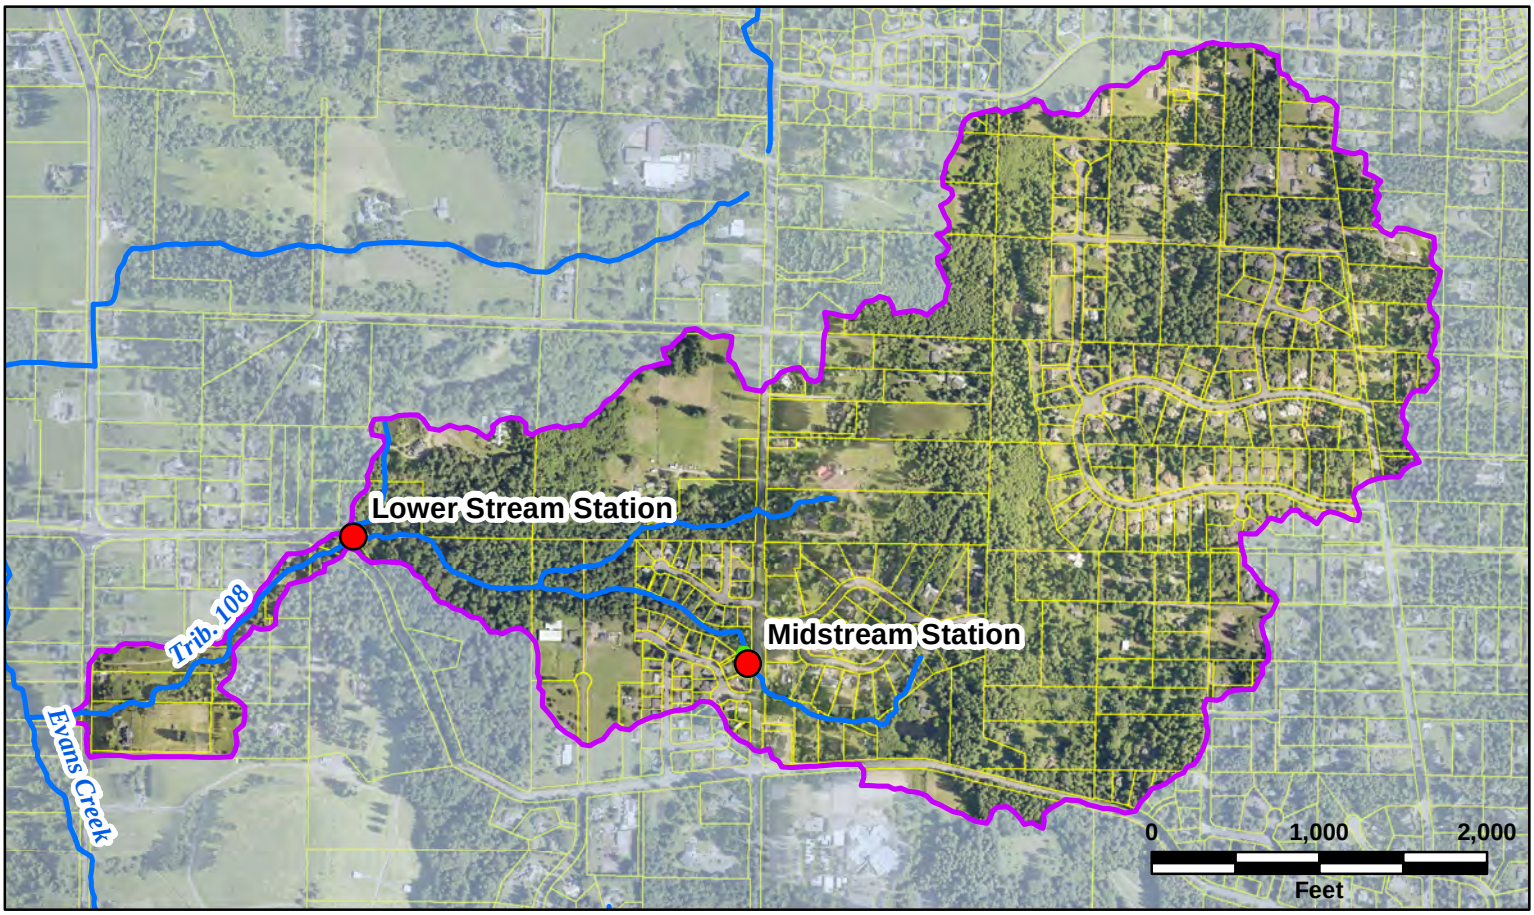
# Hydrologic Monitoring



A total of 14 fixed monitoring stations were established at the onset of the study to facilitate hydrologic monitoring in each of the study watersheds. Starting in WY2023, monitoring has occurred at 12 fixed monitoring stations; see further explanation in the Monitoring Procedures section (page 29). As noted in the literature review (Herrera 2015b) that was performed to inform the experimental design for the RPWS, numerous studies have been conducted with similar goals, but they have generally been conducted at the subbasin scale. In these studies, a hydrologic monitoring station was typically located at the outlet of the study subbasin. Therefore, efforts were made to establish hydrologic monitoring stations at the outlet of each of the study watersheds. However, because the watersheds are relatively large and because much of the rehabilitation will occur in the upper reaches of the Application watersheds, efforts were made to establish hydrologic monitoring stations at a mid-point location in each of the study watersheds as well. This goal could not be achieved for all study watersheds due to issues relating to their size and drainage patterns. The following deviations are specifically noted:

- Monticello Creek has two major tributaries that will be the target of rehabilitation efforts; therefore, three hydrologic monitoring stations were established in the watershed at the outlet and on each of the tributaries.
- The relatively pristine reach of Colin Creek that was identified for monitoring is confined to the Redmond Watershed Preserve Park. Because the watershed area within this park is relatively small, only one hydrologic monitoring station was established in this watershed.
- The relatively pristine reach of Seidel Creek that was identified for monitoring is confined to the Redmond Watershed Preserve Park. Within this area, two major tributaries of the creek flow into a large wetland complex near the border of the park. To avoid confounding hydrologic and water quality influences from this wetland, hydrologic monitoring stations were established on each tributary; and no outlet station was identified.

In addition to these considerations, the specific location of each monitoring station was also influenced by safety and property access issues. The monitoring stations established in each of the study watersheds are as follows:

### Application Watersheds

- Evans Creek Tributary 108: Two stations designated Lower Stream Station (EVALSS) and Midstream Station (EVAMS), respectively (see locations in Figure 2). Evans Creek was dropped from the study in WY2022; see further explanation in the Monitoring Procedures section (page 29).
- Monticello Creek: One station at the mouth designated Mont-Mouth (MONM); one station at the approximate midpoint of the watershed on the north tributary designated Mont–Mid-N (MONMN); and one station at the approximate midpoint of the watershed on the south tributary designated Mont–Mid-S (MONMS) (see locations in Figure 3).
- Tosh Creek: One station at the mouth designated Tosh-Mouth (TOSMO); and one station at the approximate midpoint of the watershed designated Tosh-Mid (TOSMI) (see locations in Figure 4).

### Reference Watersheds

- Colin Creek: One station at the approximate midpoint of the watershed designated Colin-Mid (COLM) (see locations in Figure 5).
- Seidel Creek: One station at the approximate midpoint of the watershed on the north tributary designated Seidel-Mid-N (SEIMN); one station at the approximate midpoint of the watershed on the south tributary designated Seidel-Mid-S (SEIMS) (see locations in Figure 6).

### Control Watersheds

- Country Creek: One station at the mouth designated Country-Mouth (COUMO); and one station at the approximate midpoint of the watershed designated Country-Mid (COUMI) (see locations in Figure 7).
- Tyler's Creek: One station at the mouth designated Tylers-Mouth (TYLMO); and one station at the approximate midpoint of the watershed designated Tylers-Mid (TYLMI) (see locations in Figure 8).

Continuous flow monitoring was originally planned to occur at all 14 monitoring stations for the duration of the RPWS; however, monitoring at the stations located in the Evans Creek watershed was suspended after WY2021 (see more detailed discussion in the Monitoring Procedures section). Data from the continuous flow monitoring are processed to calculate the following indicators for evaluating hydrologic impacts from urban development as described in DeGasperi et al. (2009):

- **High flow pulse:** Occurrence of daily average flows that are equal to or greater than a threshold set at twice (two times) the long-term daily average flow rate.
  - *High pulse count*: Number of days each water year that discrete high flow pulses occur.
  - *High pulse duration*: Annual average duration (in days) of high flow pulses during a water year.
  - *High pulse range*: Range in days between the start of the first high flow pulse and the end of the last high flow pulse during a water year.
- **Low flow pulse:** Occurrence of daily average flows that are equal to or less than a threshold set at 50 percent of the long-term daily average flow rate.
  - *Low pulse count*: Number of times each calendar year that discrete low flow pulses occurred.
  - *Low pulse duration*: Annual average duration (in days) of low flow pulses during a calendar year.
  - *Low pulse range*: Range in days between the start of the first low flow pulse and the end of the last low flow pulse during a calendar year.
- **Flow Reversal:** The number of times that the flow rate changed from an increase to a decrease or vice versa during a water year. Flow changes of less than 2 percent are not considered.
- **Richards-Baker (RB) flashiness index:** A dimensionless index of flow oscillations relative to total flow based on daily average discharge measured during a water year.
- **Flashiness ($T_{Q\ Mean}$):** The fraction of a year that mean daily discharge exceeds annual mean discharge.
- **Storm flow volume:** Total discharge volume during storm events over a water year.
- **Base flow volume:** Total discharge volume during base flow over a water year.
- **Total flow volume:** Total discharge volume over a water year.

Trends over time at each monitoring station are evaluated using parametric (Pearson's r) and nonparametric (Kendall's tau or Spearman's rho) tests of correlation between these indicators and time. Statistical significance of the correlation coefficients is evaluated based on an α-level of 0.05 for a one-tailed test. The pattern of interest is evidence that receiving water conditions are improving based on the detection of statistically significant trends in the data for one or more of these indicators in the Application watersheds while these same trends are not detected in the data for the same indicators in the Reference and Control watersheds.

## Water Quality Monitoring

A total of 14 fixed monitoring stations were established at the onset of the study to facilitate water quality monitoring in each of the study watersheds. Starting in WY2022, monitoring has occurred at 12 fixed monitoring stations; see further explanation in the Monitoring Procedures section (page 29). These stations were co-located with the monitoring stations described above for hydrologic monitoring (see Figure 2 through Figure 8). Twelve grab samples are collected annually during storm events (three each quarter) at each of the monitoring stations for the duration of the RPWS. In addition, four grab samples are also collected annually during base flow (one each quarter) at these stations. Each sample is analyzed for the following indicators for evaluating water quality impacts from urban development:

- Total suspended solids
- Turbidity
- Conductivity
- Hardness
- Dissolved organic carbon
- Fecal coliform bacteria
- Total phosphorus
- Total nitrogen
- Copper, total and dissolved
- Zinc, total and dissolved

In addition, *in situ* probes are used to continuously measure temperature at each station and conductivity at the following subset of stations: EVALSS, EVAMS, MONM, MONMS, TOSMO, SEIMN, SEIMS, COUMO, and TYLMO.

Trends over time at each monitoring station are evaluated using parametric (Pearson's r) and nonparametric (Kendall's tau or Spearman's rho) tests of correlation between these indicators and time. Where possible, variation in the indicator data related to changes in stream flow is removed prior to performing the correlation analyses using methods described in Helsel and Hirsch (2002). Use of these methods is generally applicable for indicators that tend to increase (or decrease) as a function of flow (e.g., total suspended solids). By removing this variation, trends in the indicator data can be more readily

detected in the correlation analyses. In all cases, statistical significance of the correlation coefficients is evaluated based on an α-level of 0.05 for a one-tailed test.

The sample frequency identified above for water quality monitoring was evaluated using power tests that were performed for totals suspended solids and total zinc. Power tests are used to determine the probability of detecting a trend given: 1) sample size, 2) the desired α-level, 3) magnitude of the trend, and 4) amount of variation within the data. With 16 samples collected annually (12 samples during storm events and 4 samples during base flow) over a 10-year period and a desired α-level of 0.05, results from these tests showed there was a 66 to 100 percent probability of detecting a 4 milligram per liter (mg/L) decrease in total suspended solids concentrations depending on the variability that is assumed for the data and characteristics of the trend over time (i.e., linear or non-linear). These same tests showed there is a 38 to 100 percent probability of detecting a 2 microgram per liter (µg/L) decrease in total zinc concentrations. Results from these tests are documented in the QAPP that was prepared for the study (Herrera 2015c).

Annual mass load estimates are also be derived for the following subset of indicators using the nonparametric "smearing" approach described in Helsel and Hirsch (2002): total suspended solids, total phosphorus, total nitrogen, total copper, and total zinc. Trends over time at each monitoring station is again evaluated using parametric (Pearson's r) and nonparametric (Kendall's tau or Spearman's rho) tests of correlation between these mass load estimates and time. Statistical significance of the correlation coefficients is evaluated based on an α-level of 0.05 for a one-tailed test. These analyses are used to detect potential improvements in receiving water conditions from the combined effects of improved water quality and reduced stormwater runoff.

In all cases, the pattern of interest is evidence that receiving water conditions are improving based on the detection of statistically significant trends in the data for one or more of these indicators in the Application watersheds while the same trends are not detected in the data for the same indicators in the Reference and Control watersheds.

## Physical Habitat Monitoring

A total of 19 fixed monitoring stations were established to facilitate physical habitat monitoring in each of the study watersheds. Starting in WY2022, monitoring has occurred at 17 fixed monitoring station; see further explanation in the Monitoring Procedures section (page 29). As described in the literature review (Herrera 2015b) that was performed to inform the experimental design for the RPWS, most past studies that have been performed to assess physical habitat response to watershed rehabilitation were conducted in reaches where channel rehabilitation measures were directly applied. Consequently, they were designed to only assess the localized effects of these efforts. The RPWS involves both localized channel rehabilitation and watershed scale rehabilitation through the application of structural and programmatic practices for stormwater management. Therefore, a synoptic approach was applied for establishing monitoring stations for physical habitat monitoring where stations were established in the Application watersheds in reaches that will be restored and in reaches where no physical alterations to the channel are planned. In this way, the RPWS can assess physical habitat response to both localized and basin-wide rehabilitation efforts. In addition to these considerations, the specific location of each

monitoring station was also influenced by safety and property access issues. The monitoring stations established in each of the study watersheds are as follows:

### Application Watersheds

- Evans Creek Tributary 108: Two stations designated Lower Stream Station (EVALSS) and Midstream Station (EVAMS), respectively (see locations in Figure 2).
- Monticello Creek: Five stations designated MONT-1, MONT-2, MONT-3, MONT-4, and MONT-5, respectively (see locations in Figure 3).
- Tosh Creek: Four stations designated TOSH-1, TOSH-2, TOSH-3, and TOSH-4, respectively (see locations in Figure 4).

### Reference Watersheds

- Colin Creek: One designated COLIN-1 (see locations in Figure 5).
- Seidel Creek: Three stations designated Seidel-1, Seidel-2, and Seidel-3, respectively (see locations in Figure 6).

### Control Watersheds

- Country Creek: Two stations designated Country-1 and Country-2, respectively (see locations in Figure 7).
- Tyler's Creek: Two stations designated Tylers-1 and Tylers-2, respectively (see locations in Figure 8).

The following monitoring stations were specifically selected to measure the localized physical habitat response in reaches that have either been recently restored or are likely to be restored in the future:

- MONT-3
- MONT-4
- MONT-5
- TOSH-1
- TOSH-3
- TOSH-4

Physical habitat monitoring is conducted annually at each monitoring station for the duration of the RPWS. The characteristic bed-form type will be recorded at each monitoring station, and physical habitat quality indicators is measured at 11 cross-sections (transects) and thalweg (line of steepest descent along the streambed) profile for each habitat monitoring station.

The following indicators will be measured in connection with this monitoring:

- Bed stability
- Channel dimensions
- Fish cover
- Habitat dimensions
- Habitat unit extents
- Large woody debris
- Riparian cover
- Riparian disturbance
- Riparian vegetation structure
- Sinuosity
- Substrate

The pattern of interest is evidence that receiving water conditions are improving based on the detection of trends in the data for one or more of these indicators in the Application watersheds while the same trends are not detected in the data for the same indicators in the Reference and Control watersheds.

## Sediment Quality Monitoring

A total of 19 fixed monitoring stations were established at the onset of the study to facilitate sediment quality monitoring in each of the study watersheds. Starting in WY2022, monitoring has occurred at 17 fixed monitoring stations; see further explanation in the Monitoring Procedures section (page 29). These stations were co-located with the monitoring stations described above for physical habitat monitoring (see Figure 2 through Figure 8). Sediment samples are collected annually at all 19 monitoring stations for the duration of the RPWS. Each sample is analyzed for the following indicators for evaluating sediment quality impacts from urban development:

- Total organic carbon
- Copper
- Zinc
- Polycyclic aromatic hydrocarbons
- Phthalates

Trends over time at each monitoring station are evaluated using parametric (Pearson's r) and nonparametric (Kendall's tau or Spearman's rho) tests of correlation between these indicators and time. Statistical significance of the correlation coefficients is evaluated based on an α-level of 0.05 for a one-tailed test. The pattern of interest is evidence that receiving water conditions are improving based

on the detection of statistically significant trends in the data for one or more of these indicators in the Application watersheds while the same trends are not detected in the data for the same indicators in the Reference and Control watersheds.

## Biological Monitoring

A total of 19 fixed monitoring stations were established at the onset of the study to facilitate biological monitoring in each of the study watersheds. Starting in WY2022, monitoring has occurred at 17 fixed monitoring stations; see further explanation in the Monitoring Procedures section (page 29). These stations were co-located with the monitoring stations described above for physical habitat monitoring (see Figure 2 through Figure 8). Benthic macroinvertebrate samples are collected annually at each monitoring station for the duration of the RPWS. Each sample is processed to calculate the following indicators for use in evaluating stream health:

- Benthic Index of Biotic Integrity (B-IBI)
- Taxa Richness
- Ephemeroptera Richness
- Plecoptera Richness
- Trichoptera Richness
- Clinger Percent
- Long-Lived Richness
- Intolerant Richness
- Percent Dominant
- Predator Percent
- Tolerant Percent

Trends over time at each monitoring station are evaluated using parametric (Pearson's r) and nonparametric (Kendall's tau or Spearman's rho) tests of correlation between these indicators and time. Statistical significance of the correlation coefficients is evaluated based on an α-level of 0.1 for a one-tailed test. The pattern of interest is evidence that receiving water conditions are improving based on the detection of statistically significant trends in the data for one or more of these indicators in the Application watersheds while the same trends are not detected in the data for the same indicators in the Reference and Control watersheds.

The sampling frequency identified above for biological monitoring was evaluated using the power tests described above in the Water Quality Monitoring subsection. With samples collected annually over a 10-year period and a desired α-level of 0.05, results from these tests showed there was a 63 to 96 percent probability of detecting a 9-unit increase in B-IBI scores (equivalent to a change from "fair" to "good" in biological condition) depending on the variability that is assumed for the data and

characteristics of the trend over time (i.e., linear or non-linear). Results from these tests are documented in the QAPP that was prepared for the study (Herrera 2015c).

# Effectiveness Monitoring

Roving stations will be established for the Effectiveness Monitoring component of the RPWS to verify specific structural or programmatic stormwater controls are constructed properly, performing as designed, or providing meaningful benefit. The roving stations will be moved from one year to the next once a facility's effectiveness has been verified and new facilities come online. The specific types of monitoring to be performed at each roving station will depend on the type of structural stormwater control that is being evaluated. For example, it is anticipated that only hydrologic monitoring would be performed at roving stations for facilities that are only designed for flow control (e.g., vaults). In these cases, a facility's performance would be verified based on comparisons of measured flow from the roving station to the facility's predicted flow from models used in its design. For facilities that are designed for runoff treatment, monitoring will follow guidelines from Ecology's Technology Assessment Protocol-Ecology (TAPE) (Ecology 2018) and include both hydrologic (e.g., influent and effluent flow) and water quality monitoring. In these cases, a facility's performance would be verified based on comparisons of its measured pollutant removal efficiency relative to targets that are identified in TAPE for specific treatment categories.

Effectiveness Monitoring is currently planned or ongoing for two watershed rehabilitation projects that are being implemented by the City as described in the following subsections.

## Pond Retrofit Effectiveness Monitoring

In April 2021, the City retrofitted two existing stormwater detention ponds in the Monticello Creek watershed with a continuous monitoring and adaptive control (CMAC) system to improve their performance for managing peak flows during storm events. The CMAC system is designed to optimize the performance of existing stormwater detention facilities by leveraging forecast information with onsite sensors, allowing adaptive use of the full storage volume available to more closely approximate flow patterns that existed prior to land development. Documentation related to the design and operation of these systems was provided in the WY2022 data summary report (Herrera 2023b).

Subsequent to the completion of the City's pond retrofits, the County retrofitted two additional ponds with CMAC systems in the Monticello Creek watershed that are located within its jurisdictional boundaries. These systems went online in February of 2023; however, technical issues impacted their performance until April 24, 2024, when they were subsequently deemed fully functional. Documentation related to the design and operation of these systems is provided in Appendix A. Collectively, the area managed by the four ponds that have been retrofitted by the City and County represents approximately 20 percent of the Monticello Creek watershed.

A proposal (Herrera 2021b) to conduct Effectiveness Monitoring on these ponds using funding from the SAM program was approved by Ecology on December 30, 2021. This monitoring was scheduled to initiate at the start of WY2022; however, the City's CMAC systems were not fully operational during

WY2021 and WY2022 due to technical issues. After installation of a solar panel, the Curry East CMAC system become fully functional on February 10, 2023. Due to battery issues, Whistler Ridge was not fully functional until WY2024. Hence, results from this monitoring will be summarized in the trend analysis report that will be prepared at the end of WY2025.

## Street Sweeping Effectiveness Monitoring

The trend analysis conducted by Herrera (2020b, 2020c) documented a significant decrease in total suspended solids and total copper concentrations in Monticello Creek that appeared related to a City project that progressively increased street sweeping frequency in the associated watershed. These results were consistent with another study that was implemented by the City of Seattle (SPU 2018).

To validate the effectiveness of sweeping for improving water quality, the City has obtained grant funding from King County Wastewater Treatment Division to progressively increase street sweeping in the Tosh Creek watershed. The specific goal was to confirm street sweeping is effective at reducing total suspended solids and total copper concentrations in receiving waters. The City also intends to evaluate whether street sweeping can be effective at removing other pollutants of concern that are associated with roadway runoff. Specifically, the City is collecting samples for evaluating concentrations of 6PPD-quinone (6PPD-Q) and polycyclic aromatic hydrocarbons (PAHs) during the routine water quality monitoring that is conducted for the RPWS. A widely used antioxidant in rubber tires, 6PPD-Q is an emerging contaminant in stormwater that was recently linked to acute mortality of coho salmon. PAHs are a common type of organic pollutant found in stormwater runoff that are known or probable human carcinogens and toxic to aquatic life.

This Effectiveness Monitoring specifically involved supplemental sampling and analysis for 6PPD-Q and PAHs beginning October 1, 2022, and ending September 30, 2024, at the two stations (TOSMO and TOSMI) in the Tosh Creek watershed (an Application watershed) and two stations (COUMO and COUMI) in the Country Creek watershed (a Control watershed) that were established for Status and Trends Monitoring (see description above). Street sweeping in the Tosh Creek watershed within Redmond city limits occurred one time per month from October 2022 through September 2023, and two times per month from October 2023 through September 2024. This was in addition to the regularly scheduled quarterly street sweeping. Street sweeping in the Country Creek watershed only occurred quarterly to serve as a control. More detailed information on this monitoring is provided in an addendum (Herrera 2022) to the QAPP for the RPWS. The additional sampling for 6PPD-Q and PAHs was performed using Ecology funding designated for 6PPD-Q research. Results from this monitoring will be summarized in the trend analysis report that will be prepared at the end of WY2025.

# Rehabilitation Effort Summary

As noted in the previous section, the pattern of interest for this study will be evidence that receiving water conditions are improving based on one or more indicators in the Application watersheds while conditions in the Reference and Control watersheds remain relatively static. To increase the likelihood of detecting this trend, conditions in the Application watersheds were characterized over a "baseline" period prior to the implementation of any rehabilitation efforts implemented during and after WY2016. Rehabilitation efforts that have subsequently been implemented by the City or County in each of the Application watersheds are described below under the following categories: structural retrofits, programmatic controls, and habitat enhancements.

### Evans Creek Tributary 108

- Structural Retrofits
  - In WY2017, the County constructed two stormwater detention vaults within the Evans Creek Tributary 108 watershed; one was in front of addresses 20620 and 20626 Northeast 76th Place, and the other was in front of address 20508 Northeast 78th Street. Design details for these vaults are documented in Herrera (2023).

### Monticello Creek

- Structural Retrofits
  - In April 2021, the City retrofitted two existing stormwater detention ponds (Curry East and Whistler Ridge) in the Monticello Creek watershed with a CMAC system to improve their performance for managing peak flows during storm events. However, the CMAC systems were not fully operational during WY2021 and WY2022 due to technical issues. After installation of a solar panel, the Curry East CMAC system became fully functional on February 10, 2023. Due to battery issues, Whistler Ridge was not fully functional until WY2024. Design details for these systems are documented in WY2022 Data Summary Report (Herrera 2023b).
  - Subsequent to the completion of the City's pond retrofits, the County retrofitted two additional ponds with CMAC systems in the Monticello Creek watershed that are located within its jurisdictional boundaries. These systems went online in February of 2023; however, technical issues impacted their performance until April 24, 2024, when they were subsequently deemed fully functional. Documentation related to the design and operation of these systems is provided in Appendix A. Collectively, the area managed by the four ponds that have been retrofitted by the City and County represents approximately 20 percent of the Monticello Creek watershed.

- Programmatic Controls
  - Using funding from a King County WaterWorks grant, the City implemented a street-sweeping project in the Monticello Creek watershed:
    - Street sweeping increased from quarterly to monthly in August of WY2017 and continued throughout WY2018. The street sweeping occurred on all public roads in the watershed.
    - Beginning in October of WY2019, the frequency of street sweeping increased from once per month to twice per month. This street sweeping was implemented to meet the specific goal of improving water quality in the creek and conducted in addition to street sweeping that occurs in the watershed for other operational reasons, such as collecting leaves in fall. A more detailed summary of the street sweeping is provided in Table 3.
  - *Note: Trend analyses performed by Herrera (2020b, 2020c) documented a consistent and statistically significant decrease in total suspended solids and total copper concentrations in Monticello Creek that appeared to be related to the increase in street sweeping frequency. These results are also consistent with a street sweeping study that was implemented by the City of Seattle (SPU 2018).*
- Habitat Enhancements
  - In WY2017, large woody debris was installed on an approximately 400-foot-long reach of Monticello Creek that extends downstream from Northeast 122nd Street. Approximately 400 feet of additional large woody debris was installed in July of WY2018 on the downstream end of the installation from WY2017.
  - In WY2019, invasive species removal and supplemental planting was completed in an approximately 2,000-square-foot project area located at the Fischer Village Native Growth Protection Easement downstream of 178th Avenue Northeast. Fifty-five trees and 15 shrubs were planted. Himalayan blackberry (*Rubus armeniacus*) was removed from the project area.
  - In WY2021, three separate plantings within the riparian zone of Monticello Creek were completed by the City:
    - Approximately 0.5 acre within the Fischer Village Native Growth Protective Easement (Monticello main stem, downstream of Northeast 122nd Street) was cleared of Himalayan blackberry. Two hundred trees and 200 shrubs were planted within the project area in March 2021.
    - Approximately 0.75 acre within the Ray Meadows Native Growth Protective Easement (Monticello main stem, downstream of the Fischer Village Native Growth Protective Easement) was cleared of Himalayan blackberry in March 2021. Six hundred trees were planted in the project area in October 2021.
    - Approximately 0.68 acre within the Cameron Place Native Growth Protective Easement and City-owned land (Monticello Creek—west fork, south of Northeast 116th Street) was cleared of Himalayan blackberry and reed canarygrass in January 2021. Three hundred trees and 600 shrubs were planted in the project area during March 2021.

- In WY2022, a restoration project was completed at Smith Woods as part of a fish passage and stream enhancement project north of Northeast 122nd Street. The planting area covered 11,369 square feet and included 304 trees, 281 shrubs, 1,516 groundcover plants, and 1,060 emergents.
- In WY2023, a restoration project was completed at the Ray Meadows Native Growth Protective Easement (Monticello main stem, downstream of the Fischer Village Native Growth Protective Easement). This project included cutting and grubbing blackberry more than 8,000 square feet, and planting 95 trees and 145 shrubs.

**Table 3. Summary of Street Sweeping in the Monticello Creek Watershed.**

| Type of Sweeper | Regenerative |
|---|---|
| **Percent of roads swept within the basin:** | 83% (the City did not sweep the 1.24 miles of private roads within watershed due to access issues) |
| **Type of public roads and percent of each:** | • Principal Arterial: 4%<br>• Collector Arterial: 9%<br>• Connector Streets: 4%<br>• Local Access: 83% |
| **Miles swept per year:** | • Monthly: July 2017–August 2018. A total of 83.44 miles were swept during these 14 months.<br>• Twice Monthly: September 2018–August 2019. A total of 143.04 miles were swept during these 12 months. |
| **Average passes per year:** | • Monthly: July 2017–August 2018. The watershed was swept 14 times during this time period. The biweekly sweeping was supposed to start in July 2018; however, due to an error, the contractor continued monthly sweeping until August 2018. This was addressed by adding 2 months of sweeping twice per month to the end of the contract.<br>• Twice Monthly: September 2018–August 2019. The watershed was swept 24 times during this time period. No months were missed. |

## Tosh Creek

- Structural Controls
  - The high-flow bypass pipe weir for the Tosh Creek watershed was adjusted in July of WY2017 to divert more high-flow stormwater from Tosh Creek.
- Programmatic Controls
  - Using funding from a King County WaterWorks grant, the City implemented a street-sweeping project in the Tosh Creek watershed. Street sweeping increased from quarterly to monthly from October 2022 through September 2023. The street sweeping occurred on all 3.54 miles of public roads in the watershed.
- Habitat Enhancements
  - Large woody debris was installed on an approximately 300-foot-long reach of Tosh Creek in WY2017, downstream of West Lake Sammamish Parkway. In July of WY2018, adjustments were made to this large woody debris, and minor slash was added to the reach.

- In WY2019, a planting was conducted in an approximately 40,000-square-foot project area located in the lower section of Tosh Creek, between West Lake Sammamish Parkway and the Sammamish River. Sixty-five shrubs and 627 trees were planted. Normal maintenance was performed at the site, including removal of the invasive species Himalayan blackberries and bittersweet nightshade (*Solanum dulcamara*).
- In WY2021 ongoing maintenance of the planting that occurred in WY2019 was conducted. This included planting 15 spruce trees, mulching plants, spot treating knotweed, and grubbing Himalayan blackberries. In WY2022 and WY2023 the City performed ongoing maintenance of the planting area.

# Monitoring Procedures

The QAPP that was prepared for the RPWS (Herrera 2015c) provides detailed information on the monitoring procedures that are being used for each of the following categories: hydrologic, water quality, physical habitat, sediment quality, and biological. The following deviations from these monitoring procedures are noted for monitoring that took place in WY2023:

- The YSI Pro Model 2030 that was used to make discrete *in situ* measurements of water temperature and conductivity was calibrated using a 1,000 µS standard instead of a 100 µS standard as specified in the QAPP. This change was made based on manufacturer recommendations for meter calibration. Given this change, the calibration of the meter was subsequently checked before and after each sampling event using both the 100 and 1,000 µS standards to confirm the method quality objective identified in the QAPP for meter accuracy (±5 percent) was met. Results from these calibration checks were documented on standardized field forms.
- Guidelines in the QAPP indicate that storm sampling may only occur if the following criterion for antecedent conditions is met: a period of at least 24 hours preceding the event with less than 0.04 inch of precipitation. However, this guideline was deemed too restrictive following monitoring that occurred over WY2016. Hence, this criterion was changed to allow storm event sampling after a period of at least 12 hours preceding the event with less than 0.04 inch of precipitation.

In addition, the following deviations from the QAPP are noted for monitoring across all water years:

- The QAPP for the RPWS indicates trend analyses reports should be prepared following 4, 6, 8, and 10 years of study implementation. These reports summarize the results of statistical analyses that are described in the QAPP to identify relationships between rehabilitation efforts and improving receiving water conditions. A trend analysis report (Herrera 2020b) was prepared following year 4 of the RPWS's implementation. To reduce the overall budget for the study while allowing for a longer period of data collection before conducting analyses to identify relationships between rehabilitation efforts and improving receiving water conditions, a trend analysis report following 6 years of study implementation will not be prepared. Trend analysis reports will still be prepared following 8 and 10 years of study implementation.
- The Evans Creek watershed is identified as an Application Watershed in the QAPP for the RPWS because it was prioritized by the County for rehabilitation efforts at the onset of the study; specifically, the County constructed two stormwater detention ponds within the watershed in WY2017. Monitoring has subsequently occurred at individual stations within this watershed over the period extending from WY2016 through WY2021. The performance of these ponds for improving receiving water conditions was analyzed in the trend analysis report that was prepared after 4 years of study implementation. Results from this analysis indicated the ponds are generally providing no measurable benefit to the creek. Because the County is not planning to implement any additional rehabilitation efforts within the Evans Creek watershed in the short-term, monitoring at all stations within this watershed has been suspended.

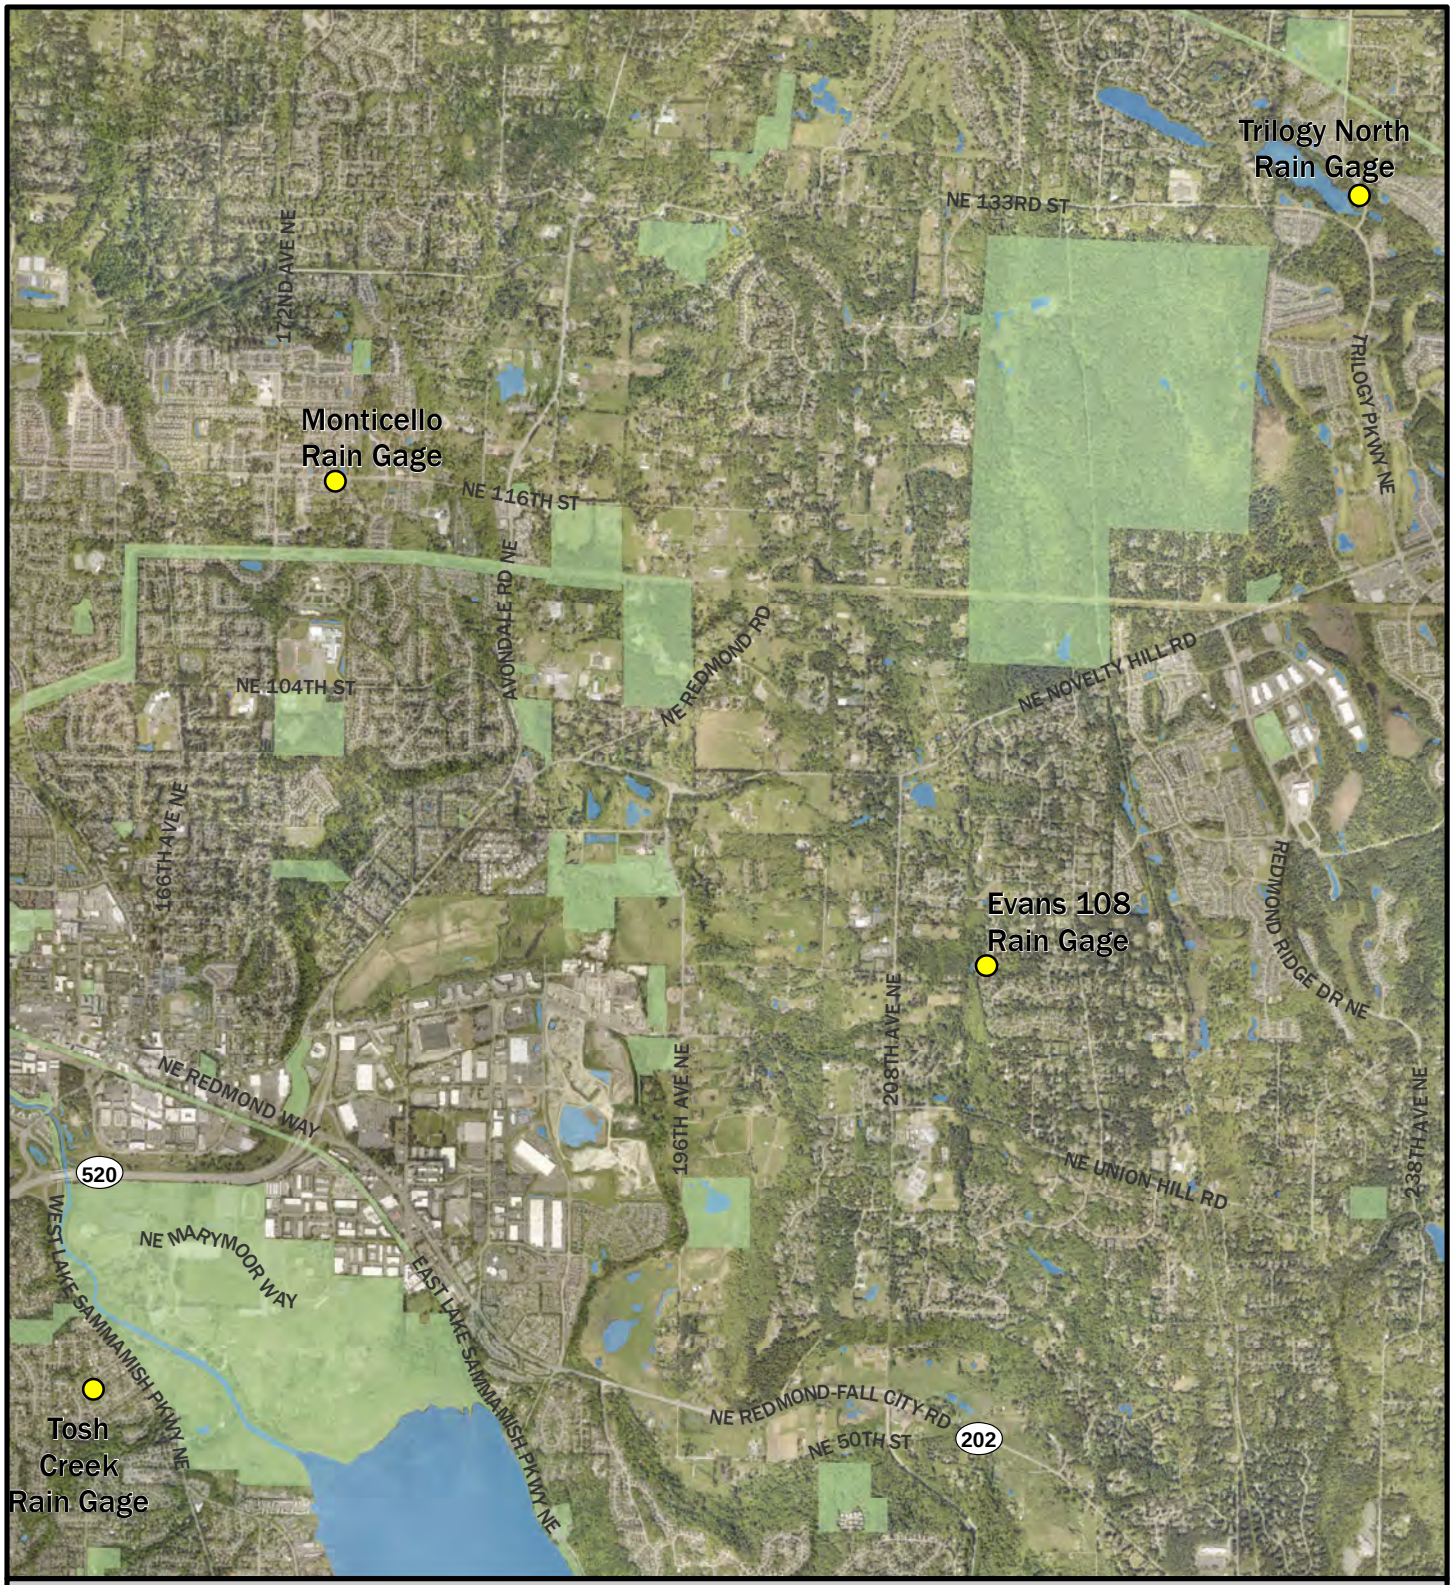
- The QAPP for the RPWS indicates physical habitat and sediment quality monitoring should occur every year through the anticipated 10-year time frame for study implementation. To reduce the overall budget, a decision was made to implement this monitoring every other year after WY2021. This change was deemed to be acceptable because large, year-to-year changes are not anticipated for these categories of monitoring.
- The QAPP for the RPWS indicates *in situ* probes will be used to continuously measure conductivity at the following subset of stations: EVALSS, EVAMS, MONM, MONMS, TOSMO, SEIMN, SEIMS, COUMO, and TYLMO. To reduce the overall budget, a decision was made to suspend this monitoring after WY2021. This change was deemed to be acceptable given *in situ* measurements for conductivity are still made at all stations in connection with base flow and storm event sampling.

The deviations identified above were made with concurrence from the SAM program coordinator and the TAC for the RPWS.

# Monitoring Results Summary

Separate sections herein summarize results from the Status and Trends Monitoring and Effectiveness Monitoring components, respectively, of the RPWS from monitoring that was conducted in WY2023.

# Status and Trends Monitoring



This section summarizes results for the Status and Trends Monitoring component of the RPWS from monitoring that was conducted over WY2023. The presentation of these results is organized under separate subsections for the following monitoring categories: hydrologic, water quality, physical habitat, sediment quality, and biological. As noted in the Introduction section of this document, trend analyses reports will be prepared to summarize the results of statistical analyses that will be performed on the compiled data from all previous years of monitoring to detect potential relationships between rehabilitation efforts and improved receiving water conditions. Therefore, this data summary report does not provide detailed analyses of the monitoring results from WY2023. A trend analysis report (Herrera 2020b) was prepared following year 4 of the RPWS's implementation. Additional trend analysis reports will be prepared following years 8 and 10 of the RPWS' implementation.

## Hydrologic Monitoring

Hydrologic monitoring for WY2023 initiated on October 1, 2022, at the 12 fixed monitoring stations that are identified in the Experimental Design section of this document (excludes the stations in the Evans Creek watershed) and continued through September 30, 2023. In addition, continuous precipitation monitoring occurred over the same period at three separate precipitation monitoring stations: two stations were established for the RPWS – Tosh and Monticello; and one station is maintained by the County for other purposes – Trilogy (Figure 9). Each station is used for measuring precipitation in the watershed for a specific creek as follows:

- Tosh station: Tosh Creek and Country Creek
- Monticello station: Tyler Creek and Monticello Creek
- Trilogy station: Seidel Creek and Colin Creek

Line plots showing the continuous flow and precipitation data collected at each station are provided in Appendix B. The quality assurance review memorandum for these data is provided in Appendix C. The quality assurance review memorandum summarizes the results of the quality assurance review of hydrologic data collected for the WY2023 and through the end of the 2023 calendar year (December 31, 2023). As documented in the quality assurance review memorandum, the continuous flow data at each station was rated as either "fair" or "good."

HERRERA

King County Aerial (2019)

K:\Projects\Y2014\14-05806-000\Project\Report\Figure9_PrecMonitorLoc_RPWP.mxd (5/4/2020)

Two stations had significant gaps in the continuous flow data record (Table 4). The COLM station had a gap extending approximately 3 months during a period of no flow when the creek was dry. To fill this gap, missing values were replaced with 0 cubic feet per second (cfs). The MONMS station had a gap of approximately 97 hours due to a probe malfunction. This gap will be filled with estimated values using linear interpolation to facilitate preparation of the next trend analysis report.

**Table 4. Gaps in Continuous Flow Data.[a]**

| Station | Gap Start Date, Time[b] | Gap Stop Date, Time[b] | Gap Duration in Hours | Flow Estimation Method |
|---|---|---|---|---|
| COLM[a] | 10/1/2022 0:00 | 10/25/2022 23:00 | 599 | No flow estimation method applicable. Period of no flow. |
| COLM[a] | 7/26/2023 18:00 | 9/25/2023 21:00 | 1,467 | No flow estimation method applicable. Period of no flow. |
| MONMS | 4/6/2023 10:05 | 4/10/2023 11:00 | 97 | No flow estimation method applicable. |

[a] Gaps in data reported for the water year (October 1, 2022, through September 30, 2023).

[b] All times are reported as Pacific Standard Time.

Once a complete data record was available for all the stations using either estimated or measured flow, the continuous flow data from each station and the applicable precipitation data were postprocessed using a custom program written in Visual Basic that delineates the start and stop time of individual storm events based on user selectable storm criteria (e.g., antecedent dry period, minimum rainfall, interevent dry period, etc.). The program then computes the following suite of summary statistics for each storm event:

- Precipitation start and stop times
- Precipitation duration
- Precipitation depth
- Precipitation average intensity
- Precipitation maximum intensity
- Precipitation antecedent dry period
- Flow start and stop times
- Flow duration
- Average flow rate
- Maximum flow rate
- Flow volume

Appendix D provides these summary statistics for the individual storm events that were delineated based on the continuous flow data from each station. Summary statistics computed across all the events for each station are provided in Table 5 to facilitate comparisons of flows across both stations and watersheds. The data from Appendix D are also used to evaluate criteria from the QAPP that serve as guidelines for defining the acceptability of specific storm events for sampling (see description section below).

**Table 5. Summary Statistics for Storm Events by Monitoring Station.**

| Station | Watershed Type | Median Average Flow Rate (cfs) | Maximum Flow Rate (cfs) | Median Flow Volume (cf) | Maximum Flow Volume (cf) |
|---|---|---|---|---|---|
| MONM | A | 1.28 | 22.41 | 83,832 | 1,052,479 |
| MONMN | A | 0.36 | 12.83 | 23,517 | 450,756 |
| MONMS | A | 0.14 | 2.56 | 9,492 | 125,229 |
| TOSMO | A | 0.79 | 14.19 | 52,044 | 323,127 |
| TOSMI | A | 0.52 | 11.70 | 38,097 | 346,883 |
| COLM | R | 0.83 | 12.26 | 50,901 | 785,935 |
| SEIMN | R | 0.54 | 2.91 | 33,622 | 164,508 |
| SEIMS | R | 0.43 | 5.15 | 33,783 | 131,670 |

cfs = cubic feet per second; cf = cubic feet

A = Application; C = Control; R = Reference

As described in the Experimental Design section of this document, data from the continuous flow monitoring will be processed to calculate a suite of 12 indicators for evaluating hydrologic impacts from urban development (see Table 2). Because many of the indicators are derived using the long-term daily average flow rate, these calculations will be performed in conjunction with the preparation of the trend analyses reports that are described in the Introduction section of this document.

## Water Quality Monitoring

Water quality monitoring for WY2023 was initiated on September 27, 2022, at the 12 fixed monitoring stations that are identified in the Experimental Design section of this document (excludes the stations in the Evans Creek watershed) and continued through September 30, 2023. Pursuant to the QAPP that was prepared for the study (Herrera 2015c), 12 grab samples are to be collected during storm events (three each quarter). In the case of events missed due to extended dry periods, the SAM program coordinator and the TAC approved making up storms in future years. In addition, four grab samples are to be collected during base flow (one each quarter) at these same stations. Grab samples were inadvertently collected during base flow twice in the fourth quarter of WY2022. Because one set of these samples was

collected late in the quarter (September 27, 2022), they were used to satisfy the baseflow sampling requirement for the first quarter of WY2023.

The dates when samples were collected during storm events are identified in Table 6. Three events were sampled in the first quarter of WY2023; five events were sampled in the second quarter; three events were sampled in the third quarter; and one storm event was sampled in the fourth quarter due to dry conditions. To the extent possible, additional storm events will be sampled in subsequent water years to make up for these missed events.

The following modified criteria from the QAPP (see the Monitoring Procedures section) serve as guidelines for defining the acceptability of specific storm events for sampling:

- **Target precipitation depth:** A minimum of 0.25 inch of precipitation over a 24-hour period
- **Antecedent conditions:** A period of at least 12 hours preceding the event with less than 0.04 inch of precipitation

Table 6 compares these criteria to data collected in WY2023 during each sampled storm event from the precipitation monitoring stations described in the previous section (Tosh, Monticello, and Trilogy). As shown, these criteria were met for all storm events sampled over WY2023 with only one exception. Specifically, the precipitation depth ranged from 0.06 to 0.14 inch across all stations during the February 7, 2023, event. Data from this event may be deemed more representative of baseflow following analysis that will be performed in connection with the next trend analysis report.

To provide additional information for assessing the acceptability of sampled storm events, line plots showing the actual time samples were collected at each station relative to the storm event hydrograph are provided in Appendix E. These plots show that approximately 82 percent of the samples were collected on the rising limb of the hydrograph; 9 percent were collected at the peak; and 1 percent were collected on the falling limb. Another 8 percent of the samples were collected in connection with the February 7, 2023, storm event described above. The line plots for this event indicate there was no appreciable rise in the hydrograph during sampling; hence, the data from this event may be deemed more representative of baseflow.

As described in the QAPP for the RPWS (Herrera 2015c), base flow samples should be collected following a period of at least 48 hours without rain. Table 6 shows the dates when samples were collected during base flow with a comparison to this criterion using data from the precipitation monitoring stations described in the previous section. This comparison shows the criterion was met during all base flow sampling with one exception. Specifically, the antecedent dry period ranged from 31.4 to 60.6 hours across all stations during the base flow event on January 20, 2023. Though below the target of 48 hours for some stations, this range was deemed close enough to include the data from this event in the final dataset. As documented in Appendix D, the preceding storm event produced approximately 0.10 to 0.84 inch of precipitation over a 5.3 to 20.9-hour period.

[a] Station is used for measuring precipitation in the watersheds for Tosh Creek and Country Creek.

[b] Station is used for measuring precipitation in the watersheds for Tyler Creek and Monticello Creek.

[c] Station is used for measuring precipitation in the watersheds for Seidel Creek and Colin Creek.

[d] Criteria for precipitation total is ≥0.25 inch in 12 hours for storm event sampling.

[e] Criteria for antecedent dry period is ≥12 hours with <0.04 inch of rain for storm event sampling and ≥48 hours with no rain for base flow sampling.

[f] Grab samples were inadvertently collected during base flow twice in the fourth quarter of WY2023. Because one set of these samples was collected late in the quarter (September 27, 2022), they were used to satisfy the baseflow sampling requirement for the first quarter of WY2023.

[g] Samples not collected at SEIMS due to unsafe conditions.

**Bold** values indicate events that did not meet criteria for storm event or base flow sampling.

Field data collection forms, chain-of-custody records, laboratory reports, and data quality audit forms from the storm event and base flow sampling during WY2023 are provided in Appendix F. The memorandum documenting results from the quality assurance review that was performed on these data is provided in Appendix G. Based on this review, 62 values (2 percent of the total number) were qualified as estimates as documented in Table 7, and 15 values (0.6 percent of the total number) were rejected. The majority of the qualified values were related to holding times (23) or field duplicate relative percent differences (17) that exceeded the criteria established in the QAPP (Herrera 2015a). Field staff routinely review sample collection and delivery protocols to reduce the need to qualify values due to these issues. Estimated values will be used with caution in subsequent trend analyses that will be performed for the study. Rejected values were all field measurements with suspected transcription errors. Steps have been taken to prevent these errors in future sampling. Rejected values will not be used in subsequent trend analyses.

**Table 7. Qualified Results from Discrete Water Quality Sampling.**

| Event Date | Station | Water Quality Indicator | Reason for Qualification | Data Flag |

J = Value qualified as an estimate based on quality assurance review.

R = Value rejected based on quality assurance review.

LCS = laboratory control sample

TSS = total suspended solids

Appendix H presents tables with the following summary statistics for pollutant concentrations measured in storm event and base flow samples over WY2023:

- N (sample size)
- Minimum
- 25th Percentile
- Median
- 75th Percentile
- Maximum
- Interquartile range
- Percent detected
- Percent exceeding the water quality standard for surface waters of the state of Washington (Ecology 2022), where applicable

In addition, Appendix I presents box and whisker plots that were developed from these same data that show the minimum and maximum values (lower and upper whiskers, respectively), 25th and 75th percentile values (lower and upper box edges, respectively), and median value (line in box). When nondetect values were present in the data, a value of one-half the detection limit was used in the computation of summary statistics.

In addition to the collection of grab samples during storm events and base flow, continuous monitoring of temperature was performed at 12 of the fixed monitoring stations that are identified in the Experimental Design section of this document for water quality monitoring (excludes the stations in the Evans Creek watershed). Line plots showing the continuous temperature at each of these stations are provided in Appendix J. These plots also show the 7-day average of the daily maximum temperatures (7-DAYMAX) relative to the applicable aquatic life temperature criterion for surface waters of the state of Washington (Ecology 2022).

As documented in the quality assurance review memorandum (Appendix C), the continuous temperature data at all stations were rated "good." Additionally, no substantial data gaps were reported except during the following two periods when the channel at the COLM station went dry:

- October 1, 2022, to October 25, 2022
- July 26, 2023, to September 25, 2023

Additionally, the MONMS station was rated "fair" due to sensor failure from April 6 to April 10, 2023.

## Physical Habitat Monitoring

Physical habitat monitoring for WY2023 was completed at 17 of the fixed monitoring stations that are identified in the Experimental Design section of this document (excludes the stations in the Evans Creek watershed) on the following dates:

- MONT-1 9/8/2023
- MONT-2 9/12/2023
- MONT-3 9/21/2023
- MONT-4 8/9/2023
- MONT-5 7/13/2023
- TOSH-1 7/18/2023
- TOSH-2 8/24/2023
- TOSH-3 9/7/2023
- TOSH-4 8/28/2023
- COLIN-1 7/6/2023
- SIDL-1 8/11/2023
- SIDL-2 8/18/2022
- SIDL-3 9/15/2023
- CTRY-1 8/16/2023
- CTRY-2 7/26/2023
- TYLR-1 7/25/2023
- TYLR-2 8/18/2023

Compiled field data from this monitoring are presented in Appendix K, and the computed indicators for evaluating physical habitat quality are presented in Appendix L. Finally, Appendix M provides tables with summary statistics for the indicators that are organized in the following categories:

- Bed stability (Table M-1)
- Channel dimensions (Table M-2)
- Fish cover (Table M-3)
- Habitat unit dimensions (Table M-4)
- Habitat unit extents (Table M-5)
- Large woody debris (Table M-6)
- Riparian cover (Table M-7)
- Riparian disturbance (Table M-8)
- Riparian vegetation structure (Table M-9)
- Sinuosity (Table M-10)
- Substrate (Table M-11)

## Sediment Quality Monitoring

Sediment quality monitoring for WY2023 was completed at 17 of the fixed monitoring stations that are identified in the Experimental Design section of this document (excludes the stations in the Evans Creek watershed) on the following dates:

- MONT-1 9/8/2023
- MONT-2 9/12/2023
- MONT-3 9/21/2023
- MONT-4 8/9/2023
- MONT-5 7/13/2023
- TOSH-1 7/18/2023
- TOSH-2 8/24/2023
- TOSH-3 9/7/2023
- TOSH-4 8/28/2023
- COLIN-1 7/6/2023
- SIDL-1 8/11/2023
- SIDL-2 8/18/2022

- SIDL-3 9/15/2023
- CTRY-1 8/16/2023
- CTRY-2 7/26/2023
- TYLR-1 7/25/2023
- TYLR-2 8/18/2023

Field data laboratory reports and data quality audit forms from sediment quality sampling in WY2023 are provided in Appendix N. The memorandum documenting results from the quality assurance review that was performed on these data is provided in Appendix O. Based on this review, three values (total organic carbon for the TOSH-2, TOSH-4, and TYLR-2 stations) were qualified as estimates; no values were rejected. Total organic carbon, zinc, and copper concentrations measured in sediment samples are presented in Table 8. Concentrations of PAHs and phthalates are presented in Table 9 and Table 10, respectively.

**Table 8. Concentrations of Total Organic Carbon, Copper, and Zinc Measured in Sediment Samples.[a]**

| Station | Watershed Type | Total Organic Carbon (percent) | Copper (mg/kg) | Zinc (mg/kg) |
|---|---|---|---|---|
| MONT-1 | A | 3.6 | 34 | 650 |
| MONT-2 | A | 1.7 | 33 | 1,100 |
| MONT-3 | A | 8.2 | 48 | 2,200 |
| MONT-4 | A | 5.0 | 46 | 260 |
| MONT-5 | A | 1.1 | 25 | 150 |
| TOSH-1 | A | 4.5 | 22 | 640 |
| TOSH-2 | A | 2 | 32 | 830 |
| TOSH-3 | A | 1.6 | 25 | 660 |
| TOSH-4 | A | 5.8 | 55 | 2,000 |
| SIDL-1 | R | 1.4 | 24 | 81 |
| SIDL-2 | R | 1.5 | 18 | 45 |
| SIDL-3 | R | 4.7 | 19 | 90 |
| COLIN-1 | R | 1.2 | 15 | 93 |
| CTRY-1 | C | 2.5 | 30 | 460 |
| CTRY-2 | C | 7.3 | 20 | 170 |
| TYLR-1 | C | 2.2 | 45 | 480 |
| TYLR-2 | C | 7.2 | 58 | 870 |

[a] Samples were processed (sieved) to make two unique samples. The first sample was sieved to less than 2.0 mm and analyzed for multiple organic compounds (PAHs and phthalates) and total organic carbon. The second sample was sieved to less than 63 µm and analyzed for metals (copper and zinc).

## Biological Monitoring

Biological monitoring for WY2023 was completed at 17 of the fixed monitoring stations that are identified in the Experimental Design section of this document (excludes the stations in the Evans Creek watershed) on the following dates:

- MONT-1 9/8/2023
- MONT-2 9/12/2023
- MONT-3 9/21/2023
- MONT-4 8/9/2023
- MONT-5 7/13/2023
- TOSH-1 7/18/2023
- TOSH-2 8/24/2023
- TOSH-3 9/7/2023
- TOSH-4 8/28/2023
- COLIN-1 7/6/2023
- SIDL-1 8/11/2023
- SIDL-2 8/18/2022
- SIDL-3 9/15/2023
- CTRY-1 8/16/2023
- CTRY-2 7/26/2023
- TYLR-1 7/25/2023
- TYLR-2 8/18/2023

The laboratory report for biological monitoring in WY2023 is provided in Appendix P. The indicators computed from these data for use in evaluating stream health are summarized in Table 11.

# Effectiveness Monitoring

This section summarizes results from the Street Sweeping Effectiveness Monitoring that was conducted over WY2023. As noted in the Introduction section of this document, trend analyses reports will be prepared to summarize the results of statistical analyses that will be performed on the compiled data to detect potential relationships between increased street sweeping and improved receiving water conditions. Therefore, this data summary report does not provide detailed analyses of the monitoring results from WY2023. Results from this monitoring will be summarized in the trend analysis report that will be prepared at the end of WY2025.

Water quality sampling for the Street Sweeping Effectiveness Monitoring occurred concurrently with sampling for the Status and Trends Monitoring (Table 6) with two exceptions:

- The base flow sample for the first quarter of WY2023 was collected on October 26, 2022, instead of September 27, 2022. The antecedent dry period for this event was 21.2 hours at the Tosh station, which is below the target of 48 hours for base flow events. However, this was a unique event aimed at collecting baseline data for the Street Sweeping Effectiveness Monitoring prior to increasing street sweeping frequency in the Tosh Creek Watershed. Hence, this deviation from the guidelines for base flow event sampling from the QAPP was deemed acceptable.
- Sampling for 6PPD-Q and PAHs did not occur during the storm event that occurred on March 13, 2023, since this was a make-up event for missed sampling in a previous water year for the Status and Trends Monitoring.

Field data collection forms, chain-of-custody records, laboratory reports, and data quality audit forms from the storm event and base flow sampling during WY2023 are provided in Appendix Q. The memorandum in Appendix G documents results from the quality assurance review that was performed on these data. As shown in Table 12, a total of 11 values for 6PPD-Q were qualified as estimates based on this review; and no values were rejected. Estimated values will be used with caution in subsequent trend analyses that will be performed for the study.

**Table 12. Qualified Results from Effectiveness Monitoring Discrete Water Quality Sampling.**

| Event Date | Station | Water Quality Indicator | Reason for Qualification | Data Flag |
|---|---|---|---|---|
| 1/20/2023 | COUMI | 6PPD-q | Elevated method blank detection limit | J |
| 2/7/2023 | COUMI, COUMO, TOSMI, TOSMO | 6PPD-q | Extraction holding time exceedance (COUMI); Low surrogate recovery (COUMO, TOSMI, TOSMO) | J |
| 3/2/2023 | COUMI, COUMO | 6PPD-q | Extraction holding time exceedance (COUMI); Low surrogate recovery (COUMO) | J |
| 4/27/2023 | COUMO, TOSMO | 6PPD-q | Low surrogate recovery | J |
| 7/11/2023 | COUMO | 6PPD-q | Method blank contamination | J |
| 1/20/2023 | COUMO | 6PPD-q | Field duplicate exceedance | J |

J = Value qualified as an estimate based on quality assurance review.

Appendix R presents tables with the following summary statistics for 6PPD-Q and PAHs concentrations measured in storm event and base flow samples over WY2023:

- N (sample size)
- Minimum
- 25th Percentile
- Median
- 75th Percentile
- Maximum
- Interquartile range
- Percent detected

In addition, Appendix S presents box and whisker plots that were developed from these same data that show the minimum and maximum values (lower and upper whiskers, respectively), 25th and 75th percentile values (lower and upper box edges, respectively), and median value (line in box). When nondetect values were present in the data, a value of one-half the detection limit was used in the computation of summary statistics.

# PROJECT OVERVIEW

The Bear Creek CMAC project proposes to replace existing outlet control structure risers at two detention pond locations near Redmond, Washington, owned and operated by King County Department of Natural Resources and Parks, Water and Land Resources Division (KC DNRP WLRD). The project is subject to the 2021 King County Surface Water Design Manual (KCSWDM), the manual in effect at the time of project design and permitting.

The two project site locations are just outside of the City of Redmond city limits. The Crown Heights and Wyndham Knoll project locations are shown in Figure 2, Site Location. The existing standard risers at the project sites will be replaced with risers fitted with an OptiRTC Continuous Monitoring and Adaptive Control (CMAC) system. The CMAC system is a remote-operated flow control valve that is functionally equivalent to the standard outlet control structure for detention ponds, as per the Washington State Department of Ecology functional equivalence letter dated November 1, 2018 (see Appendix D).

The proposed project is determined to be subject to a Targeted Drainage Review Category #2, per KCSWDM Section 1.1.2.2 and Figure 1.1.2.A. A summary of requirements and proposed mitigation is provided in Figure 1, TIR Worksheet.

## EXISTING SITE CONDITIONS

The Crown Heights and Wyndham Knoll detention ponds detain runoff from surrounding residential developments and undeveloped areas. The Crown Heights detention pond facility captures runoff from approximately 15.6 acres of tributary area. Outflow from the pond is conveyed through buried stormwater pipes 0.35 miles before discharging into the Wyndham Knoll detention pond. The Wyndham Knoll detention pond receives runoff from approximately 32.7 acres of tributary area(inclusive of that managed by the Crown Heights facility).

The Crown Heights detention pond discharges to a 54 inch-diameter WSDOT Type 2 Catch Basin containing an 18 inch-diameter corrugated metal multi-orifice riser structure. The Wyndham Knoll detention pond outlets to a 72 inch-diameter WSDOT Type 2 Catch Basin containing an 18 inch-diameter corrugated metal multi-orifice riser structure. The OptiRTC Technical Memorandum found in Appendix A contains information about the existing site conditions including the riser structures orifice diameters. Table 1 compares the existing and proposed detention pond areas and control structures.

# PROPOSED SITE CONDITIONS

OptiRTC CMAC flow control systems will replace the outlet control riser structures at both project locations. The active flow control valve at the Crown Heights location will be 8 inches in diameter; the active flow control valve at the Wyndham Knoll location will be 8 inches in diameter. The existing WSDOT Type 2 Catch Basins and outlet pipes will remain. The existing 54 inch corrugated metal multi-orifice riser structures with shear gates will be replaced with similar structures, fitted with the OptiRTC CMAC systems. Solar power supply control stations will be installed adjacent to the flow control structures at both project locations. Appendix A contains a detailed description of the proposed OptiRTC CMAC system retrofits. Table 2 compares the existing and proposed outlet structures at both project locations.

Although drainage areas have been delineated to represent existing conditions (Figure 3), precise basin delineations are not necessary for OptiRTC CMAC performance, as the CMAC valves will be calibrated in the field after installation.

This project will result in a maximum of 100 square feet of new hard surface (the solar panel and battery case) at each of the two project locations, for a total of 200 square feet of new hard surface. Table 1 shows expected new hard surface areas for each Threshold Discharge Area (TDA).

The Crown Heights project (TDA 1) will require a total land disturbance area of up to 380 square feet. The land disturbance at Crown Heights will consist of up to 140 linear feet of power conduit trenching, up to 2 feet wide, and up to 100 square feet of new impervious surface for installation of the rain gauge, solar panel, and controller, see Table 1.

The Wyndham Knoll project (TDA 2) will require a total land disturbance area of up to 320 square feet. The land disturbance at Wyndham Knoll will consist of up to 110 linear feet of power conduit trenching, up to 2 feet wide, and up to 100 square feet of new impervious surface for installation of the rain gauge, solar panel, and controller, see Table 1.

**Table 1. Proposed New Hard Surfaces and Land Disturbance Areas.**

| Extent | Threshold Discharge Area (TDA) | New Hard Surface (SF) | Land Disturbance (SF) |
|---|---|---|---|
| Site (Both Project Locations) | Crown Heights (TDA 1) | 100 (max.) | 380 (max.) |
| | Wyndham Knoll (TDA 2) | 100 (max.) | 320 (max.) |

## Part 6 SWDM ADJUSTMENT APPROVALS

Type (circle one): Standard / Experimental / (Blanket)

Description: (include conditions in TIR Section 2)

This project utilizes an OptiRTC Continuous Monitoring and Adaptive Control (CMAC) system as a functional equivalent to the standard outlet control structure for detention ponds, as described in the Stormwater Manual for Western Washington. This OptiRTC system achieved functional equivalence status on Nov 1, 2018 under the Washington Department of Ecology. King Co. has approved this system for previous retrofit projects.

Approved Adjustment No. _____ Date of Approval: _____

[1] DFW: WA State Dept. of Fish and Wildlife. HPA: hydraulic project approval. COE: (Army) Corps of Engineers. CWA: Clean Water Act. ECY: WA State Dept. of Ecology. FEMA: Federal Emergency Management Agency. ESA: Endangered Species Act.

# CONDITIONS AND REQUIREMENTS SUMMARY

The project proposes to modify a drainage pipe that receives runoff from a 12-inch or larger drainage pipe and therefore requires drainage review. As per KCSWDM Section 1.1.2.2 and Figure 1.1.2.A (FLOW CHART FOR DETERMINING TYPE OF DRAINAGE REVIEW REQUIRED), it is subject to Targeted Drainage Review Category #2 and therefore must meet Core Requirements #1, #2, #4, #5, #6, #7, and Special Requirement #4. This public flow control retrofit project will result in up to 700 square feet of land disturbance to existing vegetated surface which will be restored in kind and up to 200 square feet of new impervious surface.

## CORE REQUIREMENT #1: DISCHARGE AT THE NATURAL LOCATION

Drainage from the Crown Heights project location discharges to an existing stormwater conveyance system. Changes made by this project to the Crown Heights drainage hydrology average a 64 percent reduction in the modeled discharge rate compared with existing conditions. See the OptiRTC Technical Memorandum in Appendix A for hydrologic modeling results. No changes will be made to the downstream conveyance or discharge point.

Drainage from the Wyndham Knoll outlet structure discharges to the surface within its parcel. Changes made by this project to the Wyndham Knoll drainage hydrology average a 68 percent reduction in the modeled discharge rate compared with existing conditions. See the OptiRTC Technical Memorandum in Appendix A for hydrologic modeling results. No changes will be made to the downstream conveyance or discharge point.

## CORE REQUIREMENT #2: OFFSITE ANALYSIS

A Level 1 downstream analysis was conducted on January 21, 2022, by Christopher Webb, PE of Herrera to identify potential offsite drainage and water quality issues that may be exacerbated by the proposed project. No issues requiring a change in design were identified; see Offsite Analysis (page 21) for a detailed description of reviewed references and the field inspection.

## CORE REQUIREMENT #3: FLOW CONTROL

This project will add up to 200 square feet of new hard surface and will have no replaced hard surfaces. As per the Exemption from Core Requirement #3, this project is exempt because it

meets both 1) less than 5,000 square feet of new plus replaced impervious surface will be created, 2) less than 3/4 acres of new pervious surface will be added.

However, this project is expected to improve the flow control facilities by installing the proposed OptiRTC CMAC systems. They are expected to reduce critical flows when compared with existing conditions. Model results show that critical flows will be reduced by an average of 64 percent at the Crown Heights location and an average of 68 percent at the Wyndham Knoll location. The OptiRTC Technical Memorandum in Appendix A contains information on the performance of the proposed retrofits and WWHM modelling results for both locations.

## Core Requirement #4: Conveyance System

No changes will be made to the conveyance system at either project location.

## Core Requirement #5: Erosion and Sediment Control

Up to approximately 380 square feet of land disturbance may be required for project completion at the Crown Heights location and up to approximately 320 square feet of land disturbance will be required for project completion at the Wyndham Knoll location. This maximum total of 700 square feet of land disturbance will be related to the installation of power conduit and small foundations for the solar power and control equipment.

This disturbance will occur within the pasture landcover adjacent to the ponds and based on the anticipated construction methods is expected to be stabilized with mulch and seed within 2 days of construction. Construction is planned to occur prior to September 30th within the dry season. Therefore, due to the limited extent and duration of exposed soils and occurring only during the dry season, no structural erosion control BMPs are proposed in addition to the stabilization of exposed soils following installation of the conduit and foundations.

A Construction Stormwater Pollution Prevention (CSWPP) plan will be included in the plan set for the proposed project and will provide temporary Erosion and Sediment Control (ESC) measures and the Stormwater Pollution Prevention and Spill Control (SWPPS) information. The plan will be per the standards described in the King County *Construction Stormwater Pollution Prevention Standards* (KCSWDM Appendix D).

## Core Requirement #6: Maintenance and Operations

The existing drainage facilities are maintained and operated by KCDNRP and will continue to be maintained and operated by KCDNRP after the installation of the OptiRTC CMAC system. Following the installation of the OptiRTC CMAC system, all current Maintenance & Operations activities for the facility will continue. There will be additional Maintenance & Operations activities specific to the OptiRTC CMAC system. These OptiRTC CMAC system specific activities are described in the OptiRTC Maintenance & Operations manual provided in Appendix B.

## Core Requirement #7: Financial Guarantees and Liability

The existing and proposed flow control system retrofits will be owned and operated by KCDNRP. Therefore, the financial guarantee requirements of King County Ordinance 12020 and the liability requirements of King County Code 9.04.100 do not apply.

## Core Requirement #8: Water Quality

Both TDAs are within a basic water quality treatment area (King County Water Quality Applications Map, KCDNRP, 1998). However, this project proposes to add a total of up to 200 square feet of new and no replaced impervious surfaces and is therefore exempt from providing water quality treatment per the Surface Area Exemption, Section 1.2.8 of the KCSWDM.

## Core Requirement #9: Flow Control BMPs

This project proposes less than 2,000 square feet of new plus replaced impervious surface and is therefore exempt from Core Requirement #9.

## Special Requirement #4: Source Control

The proposed project does not require a commercial building or commercial site development permit and is therefore exempt from Special Requirement #4.

# OFFSITE ANALYSIS

A Level 1 offsite analysis was completed for the project site by Herrera Engineer Christopher Webb, PE. The installation of the OptiRTC CMAC system is anticipated to reduce discharge rates from the Crown Heights and Wyndham Knoll detention pond facilities and more closely match the pre-developed hydrology. As such, the Level 1 analysis did not identify any potential offsite drainage problems that would be exacerbated by the proposed retrofits. The four tasks completed for the Level 1 offsite analysis are described below.

## TASK 1: STUDY AREA DEFINITION AND MAPS

Per KCSWDM Core Requirement #2, the offsite analysis extends downstream one mile from each proposed project discharge location. The proposed project lies within two TDAs in series: the discharge point from Crown Heights (TDA 1) is connected through piped conveyance to the inlet of the Wyndham Knoll detention facility (TDA 2), separated by 0.35 miles of flow path. A tributary basin of 32.7 acres of single-family residential area flows to the discharge point of the Wyndham Knoll TDA, including the 15.6-acre tributary area to the Crown Heights TDA discharge point. displays the offsite analysis study area and potential and existing problems identified during this analysis.

## TASK 2: RESOURCE REVIEW

The following resources were reviewed for upstream and downstream existing and potential flooding, drainage, erosion, and water quality problems that the proposed project may impact.

1. King County Department of Natural Resources and Parks, Water and Land Resources Division. April 2018. *Bear Creek Watershed Management Study* (BCWMS). Report prepared in coordination with Snohomish County, City of Redmond, City of Woodinville, and Washington Department of Transportation, in compliance with NPDES Permit conditions.

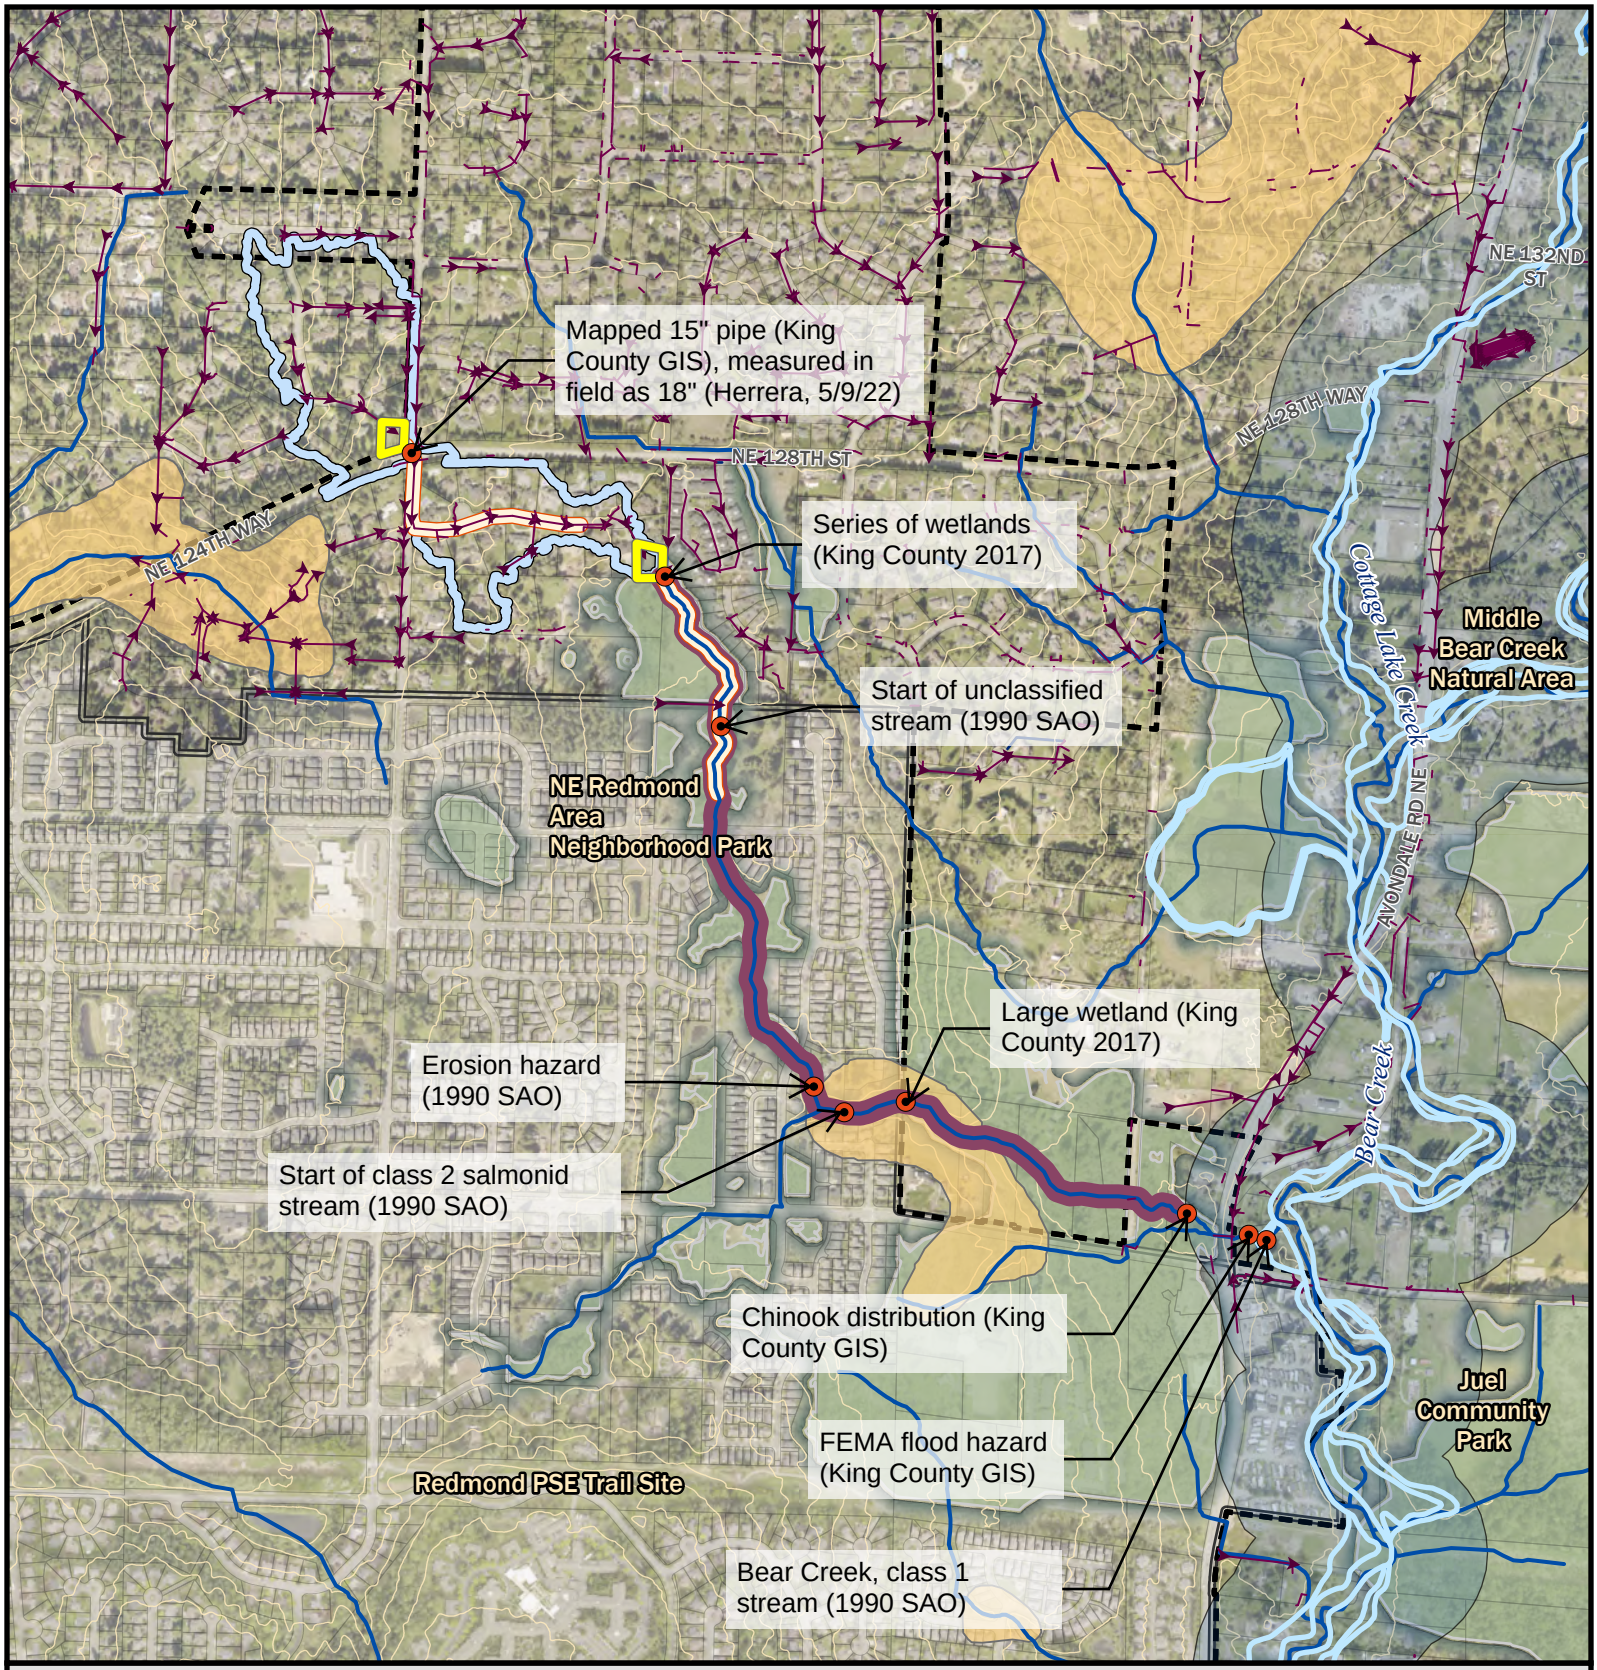
    - Wetlands data set used in Figure 5 of above report (communication with King County GIS Center April 26, 2022).

2. King County Surface Water Management Division. *Bear Creek Basin Plan.* September 1995. Report prepared in coordination with Snohomish County Surface Water Management, and City of Redmond Stormwater Division.

3. King County GIS Center. King County iMap GIS data. Accessed January 20, 2022. <https://gismaps.kingcounty.gov/iMap/>. Data sets analyzed:
    - Potential landslide hazard areas and potential steep slope hazard areas (2016)
    - Erosion, landslide, seismic, and coalmine hazards (1990 Sensitive Areas Ordinance (SAO))
    - Streams and wetlands (1990 SAO)
    - Lakes and large rivers
    - Chinook distribution
    - Channel migration hazard areas
    - Local parcels with sensitive area notices on title
    - Critical aquifer recharge areas, areas susceptible to groundwater contamination, and wellhead protection areas (1-, 5-, and 10-year time of travel)
    - FEMA floodplains
4. Washington State Department of Ecology. Washington State Water Quality Atlas. Accessed January 20, 2022. <https://fortress.wa.gov/ecy/waterqualityatlas/StartPage.aspx>. Data sets analyzed:
    - 303(d) and 305(b) List
5. King County Department of Natural Resources and Parks, Water and Land Resources Division. Level 1 downstream drainage complaints. Received February 17, 2022. Complaint numbers analyzed:
    - 2012-0757
    - 2013-0307
    - 2017-0097
    - 2018-0298

The Crown Heights project location drains into existing stormwater conveyance pipes and discharges to the Wyndham Knoll project location detention pond facility. All pipes between the Crown Heights and Wyndham Knoll facilities are mapped by King County GIS as 18-inch-diameter pipes, except for one corrugated metal pipe mapped as 15-inch-diameter that crosses the intersection of 172nd Ave Northeast and Northeast 124th Way. On May 9, 2022, David

Garcia of Herrera measured the pipe mapped as 15-inch and confirmed that it is 18-inch. Herrera recommends King County updated its GIS data accordingly.



The reviewed resources identified wetlands in series adjacent to the Wyndham Knoll facility discharge point and continuing for approximately 0.50 miles, an unclassified stream 0.16 miles, an erosion hazard 0.53 miles, a class 2 salmonid stream 0.57 miles, Chinook distribution 0.91 miles, FEMA flood hazard approximately 1.0 miles, and class 1 stream (Bear Creek) 1.0 miles downstream of the Wyndham Knoll location.

The class 2 salmonid tributary to Bear Creek downstream of the Wyndham Knoll project location was identified to carry Total Maximum Daily Loads (TMDLs) for bacteria and temperature, and a Category 2 303(d) designation for bioassessment.

Reviewed downstream drainage complaints did not identify any issues requiring attention. The reviewed downstream drainage complaints are compiled in Appendix C.

The only potential existing problem identified through the reviewed resources was the 15-inch pipe downstream of an 18-inch pipe. However, field reconnaissance confirmed that the pipe size was mapped incorrectly, and it is 18-inch. There were no downstream flooding or erosion problems identified that are likely to be exacerbated by this project. Existing oil spill control functionality and emergency engagement of the existing flow control riser structure designs will remain in place at both locations.

In Summary, this project has not identified any existing or potential/predictable downstream flooding, erosion, and water quality problems requiring mitigation. See Figure 6 for the Off-Site Analysis Drainage System Table.

# TASK 3: FIELD INSPECTION

A field inspection was conducted in the morning on January 21, 2022; weather was mostly cloudy, and the temperature ranged from 41 to 47 degrees Fahrenheit. Weather the previous few days included about a quarter of an inch of precipitation. The project site and downstream areas accessible by public ROW were inspected. Adjacent wetlands downstream of the Wyndham Knoll facility were found during the Task 2 resource review and visually confirmed during the field inspection.

The observed project site facilities, control structures, land use, and topography is consistent with the facility record drawings and other information previously obtained. The control structure at the Crown Heights location contained standing water; see Figure 7. The Crown Heights location drains via an 18-inch diameter reinforced concrete pipe (RCP) to a system of buried stormwater pipes, through which it discharges to the Wyndham Knoll facility 0.35 miles downstream.

The control structure at the Wyndham Knoll location had water higher than the second orifice and sustained a steady baseflow; see Figure 8. The Wyndham Knoll location surface discharges within its parcel through an 18-inch-diameter pipe to an existing vegetated swale; see Figure 9. Directly downstream of the surface discharge point is a vegetated parcel, mapped as a wetland (BCWMS 2018).

**Figure 7. Existing Multi-Orifice Riser and Control Structure at the Crown Heights Project Location.**

Catch basin is sustaining high standing water level and steady baseflows.

**Figure 8. Existing Control Structures for the Wyndham Knoll Project Location.**

Project does not propose to change the discharge point or downstream conveyance at either location.

**Figure 9. Surface Discharge Point from the Wyndham Knoll Control Structure.**

# TASK 4: DRAINAGE SYSTEM DESCRIPTION AND PROBLEM DESCRIPTIONS

Following is a description of the existing drainage system and any known associated problems.

## Drainage System Descriptions

The Crown Heights detention pond receives runoff from two 6-inch pipes from the north. The pond then drains through a 12-inch-diameter corrugated metal pipe (CMP) into a 54-inch type 2 control structure, which drains into an 18-inch-diameter RCP. Drainage from an 18-inch-diameter pipe flowing south along 172nd Avenue Northeast joins discharge from Crown Heights through an 18-inch-diameter CMP, and then into a CMP that drains from northwest to southeast across the intersection of 172nd Avenue Northeast and Northeast 128th Street. This CMP is mapped by King County GIS as having a diameter of 15 inches, however, was field verified to be 18-inches. From there, an 18-inch-diameter line-corrugated polyethylene (LCPE) pipe system conveys the drainage south along 172nd Avenue Northeast. From there, the drainage combines with conveyance eastbound along Northeast 126th Place and continues through an 18-inch-diameter LCPE pipe system until it discharges into the Wyndham Knoll detention pond.

The Wyndham Knoll detention pond receives drainage from the Crown Heights conveyance system described in the previous paragraph and discharges into an 18-inch-diameter CMP, which flows into a 72-inch type 2 control structure and out through an 18-inch pipe. Runoff from an 18-inch concrete pipe flowing from the north joins the discharge from Wyndham Knoll within a 48-inch type 2 catch basin and drains south through a 24-inch-diameter pipe, discharging to a surface water course that flows south through an adjacent wetland (BCWMS 2018).

A series of mapped wetlands continue along the water course downstream of the Wyndham Knoll discharge point for approximately 0.5 miles (BCWMS 2018). The water source becomes an unclassified stream (1990 SAO, King County iMap) at Smith Woods 0.16 miles to the south of the discharge point. An erosion hazard is mapped (1990 SAO, King County iMap) 0.53 miles downstream of the discharge point. The water course becomes a class 2 salmonid stream approximately 0.57 miles downstream, and a large wetland (BCWMS 2018) begins at 0.62 miles downstream of the discharge point. The flow path encounters mapped Chinook distribution at 0.91 miles downstream of the discharge point. Bear Creek (class 1 stream) and a FEMA flood hazard zone are approximately 1.0 mile downstream of the project discharge point.

## Problem Descriptions

As part of the Crown Heights downstream flow path, as described in the Drainage Problem Descriptions subsection above, water flows from an 18-inch pipe into a 15-inch-diameter pipe, as mapped by King County GIS. This pipe drains from northwest to southeast across the intersection of 172nd Avenue Northeast and Northeast 128th Street.

Herrera Scientist David Garcia measured the inner diameter of this pipe as 18 inches on May 9, 2022, Figure 10. The results of the field measurement relieve concerns that this pipe would present a downstream flow capacity problem. It is recommended that the size of this pipe be updated in the King County GIS database to reflect this field reconnaissance. No downstream conveyance system nuisance problems were identified.

A series of wetlands are mapped (BCWMS 2018) for the first one-half miles of the flow path downstream of the Wyndham Knoll discharge point. This project qualifies as a category 2 targeted drainage review retrofit project and is therefore exempt from flow control standards per Core Requirement 3. As such, potential impacts to wetlands hydrology need not be analyzed, per KCSWDM Section 1.2.2.1.1.

**Figure 10. Field Measurement of Downstream End of Corrugated Metal Pipe Crossing Intersection of 172nd Avenue Northeast and Northeast 128th Street, May 9, 2022.**

# TASK 5: MITIGATION OF EXISTING OR POTENTIAL PROBLEMS

Potential downstream local flooding is expected to be reduced because the proposed project is modeled to reduce critical flows from both project locations. Per modelling conducted by OptiRTC, when compared to the existing conditions, the proposed project expects a modeled average reduction of 64 percent and 68 percent in critical flows from the Crown Heights and Wyndham Knoll locations, respectively. See Appendix A for hydrologic modeling results and discussion.

# FLOW CONTROL, LOW IMPACT DEVELOPMENT (LID), AND WATER QUALITY FACILITY ANALYSIS AND DESIGN

The project proposes to modify a control structure that receives runoff from a 12 inch or larger pipe at each location, so must meet the requirements for a Category 2 Targeted Drainage Review, per KCSWDM Section 1.1.2.2 and Figure 1.1.2.A. This section of the report is not required for the project. However, while the proposed OptiRTC CMAC retrofits do not reach pre-developed flow conditions, they do reduce critical flows when compared with existing conditions. Model results show that critical flows will be reduced by an average of 64 percent at the Crown Heights location and an average of 68 percent at the Wyndham Knoll location. The OptiRTC Technical Memorandum in Appendix A contains more information on the proposed retrofits and WWHM model hydrological results for both locations.

## EXISTING SITE HYDROLOGY

The existing detention pond facility project locations are situated in single family residence neighborhoods, with accompanying roads, landscaping, and trees. The land surface is vegetated and underlain by outwash soils. The site is divided into two Threshold Discharge Areas (TDAs): Crown Heights (TDA 1) and Wyndham Knoll (TDA 2). Stormwater runoff from the Crown Heights TDA leaves the site through a control structure and an 18-inch-diameter pipe system, from which it discharges into the Wyndham Knoll detention pond facility after 0.35 miles. Stormwater runoff from the Wyndham Knoll TDA leaves the site via an 18-inch pipe and control structure, where it discharges into a vegetated swale and water course through a series of wetlands, joining Bear Creek after 1.0 miles. All underlying soil is categorized as outwash, see Figure 4.

# PROPOSED SITE HYDROLOGY

The proposed project site hydrology is characterized by reduced critical flows when compared to the existing site hydrology. Proposed site hydrology is discussed in the OptiRTC Technical Memorandum in Appendix A. The existing land surface will remain unchanged in the proposed condition, except for the addition of a maximum of 200 square feet of new impervious surface and an approximate maximum of 700 square feet of land disturbance for the entire project.

## Performance Standards

The flow control portion of this report is not required, and performance standards do not apply.

# FLOW CONTROL SYSTEM

## Flow Control Facility (Core Requirement #3)

The project proposes installing an OptiRTC CMAC flow control retrofit at each location of the project site. Flow control is not a requirement of the Targeted Drainage Review; however, the Technical Memorandum in Appendix A reports the proposed flow control facility retrofits and hydrology. Appendix D contains the functional equivalency determination by the Washington State Department of Ecology for the OptiRTC CMAC system.

# CONVEYANCE SYSTEM ANALYSIS AND DESIGN

No changes will be made to the conveyance systems upstream, at, or downstream of the project locations.

# SPECIAL REPORTS AND STUDIES

No special reports or studies have been requested by King County, the permitting agency, at this time.

# OTHER PERMITS

No other permits are anticipated to be required for the proposed project.

# CSWPP PLAN ANALYSIS AND DESIGN

Approximately 380 square feet of site disturbance work will be required for completion of the proposed retrofit at the Crown Heights project location. Approximately 320 square feet of site disturbance work will be required for completion of the proposed retrofit at the Crown Heights project location. This project is therefore subject to small site requirements (less than one acre of disturbed land), per KCSWDM Appendix D, section D.3.2.

A small site CSWPP plan is included with the site plans for this project, see Appendix E. The small site CSWPP plan consists of two parts: the erosion sediment control (ESC) plan and the stormwater pollution prevention and spill control (SWPPS) plan. Both the ESC and SWPPS plans meet the requirements in KCSWDM Appendix D. Of the evaluated applicable stormwater pollution control measures, the following will be implemented for construction of this project:

- Construction Timing
    - All earthwork will occur during the dry season and the site will be stabilized before September 30.
- Control sediment
    - Undisturbed vegetation on site will be sufficient to act as a vegetated strip to mitigate surface runoff during construction.
- Final stabilization
    - Exposed soil will be stabilized by mulching and seeding after disturbance activities are complete.

# BOND QUANTITIES, FACILITY SUMMARIES, AND DECLARATION OF COVENANT

This section is not applicable, as this project qualifies as a category 2 targeted drainage retrofit project and is internal to King County.

# OPERATIONS AND MAINTENANCE MANUAL

King County currently operates and maintains the two pond facilities that are the subject to this project. The current operations and maintenance activities for these ponds will remain unchanged. Additional operations and maintenance activities specific to the OptiRTC CMAC system will be required. The additional Operations and Maintenance instructions specific to the OptiRTC CMAC system for these retrofits are included as Appendix B.

# Preliminary Results from WWHM-CMAC Modeling for King County-owned Stormwater Facilities

## Introduction

This memorandum outlines the preliminary results from initial modeling runs through Opti's Washington Department of Ecology approved continuous monitoring and adaptive control (CMAC) modeling tool to determine the relative improvements of pond retrofits with Opti's technology. The results presented in the memorandum are for planning purposes only to inform site selection of the highest potential benefit candidate facilities for retrofit.

### Bear Creek Flow-Duration Curve Preliminary Modeling Results:

Two existing stormwater ponds located within the Bear Creek watershed in King County, WA were evaluated for the use of Opti Active Controls. The ponds, Wyndham Knoll and Crown Heights, are existing wet ponds that currently mitigate flows using a multi-staged riser structure with low-flow orifices. Using the Western Washington Hydrology Model (WWHM), flow-duration curves were calculated for these sites under the following scenarios:

1. Predeveloped conditions
2. Developed, unmitigated conditions
3. Developed, mitigated - passive (current conditions)
4. Developed, mitigated - active (Active Controls)

This analysis compared the duration of critical flow rates using continuous rainfall data for a 61 year period (1948 - 2009). The potential improvement in site performance was estimated using continuous simulation of the existing stormwater basins with and without active controls. Results indicate that implementing active controls at these ponds could enable substantial improvements over existing conditions, reducing the duration of flows within the critical range.

### Stormwater Retrofit Overview:

Characteristics obtained from record drawings of each pond were used as model inputs (Table 1). For the active control scenario, the outlet structure was modeled by replacing the three existing orifices with an active valve that can modulate between 0 and 100% open. In all cases, the active valve was sized such that when fully open, the flow through the valve would at least match the discharge through the existing outlet structure at all stages.

www.optirtc.com

*Table 1: Site Characteristics for Proposed Retrofits*

| | Crown Heights | Wyndham Knoll |
|---|---|---|
| Active Storage Volume (ac-ft) | 0.406 | 0.575 |
| Contributing Drainage Area (Acres) | 16.63 | 26.2 |
| Impervious Area (Acres) | 6.25 | 7.86 |
| Passive Outlet Diameter (in) | 2.5” at 0.00 ft<br>2.75” at 1.04 ft<br>3.375” at 2.09 ft | 1.5” at 0.00 ft<br>1.69” at 1.33 ft<br>2.0625” at 2.67 ft |
| Riser Diameter (in) | 18 | 18 |
| Proposed Active Valve Diameter (in) | 8 | 6 |
| Critical Erosive Flow Range - Lower Limit (cfs) | 0.22 | 0.20 |
| Critical Erosive Flow Range - Upper Limit (cfs) | 1.14 | 2.78 |

Critical flows for the ponds in question were defined as the range between 50% of the 2-year pre-development flow (determined using WWHM assuming a forested condition) and the 10-year pre-development flow. Simulations were run with the goal of achieving pre-development flows, if possible, through the use of active controls.

In addition to the direct drainage area contributing to each stormwater facility, the modeled outflow from the Crown Heights facility was routed through a simple SWMM model and used as an additional direct inflow to the Wyndham Knoll facility.

## Methodology and Results:

Western Washington Hydrology Model simulations were completed for the following scenarios to demonstrate CMAC benefits across the range of critical flows:

1. Predeveloped conditions
2. Developed, unmitigated conditions
3. Developed, mitigated - passive (current conditions)
4. Developed, mitigated - active (Active Controls)

Boston, MA 02116
1-844-OPTIRTC
www.optirtc.com

To simulate the active control scenario, runoff to the pond from WWHM was used as an input to a Washington Department of Ecology approved spreadsheet routing model that simulates Opti's control logic for use in demonstration level of service with Opti's technology. For all ponds, the duration (hours) exceeding the range of critical flows was compared for the four scenarios with the average reduction in flow between the active and passive conditions (Scenarios 3 & 4) shown in Table 2.

*Table 2: Results Summary for Proposed Retrofits*

| | **Crown Heights** | **Wyndham Knoll** |
|---|---|---|
| **Average Reduction in Critical Flow Durations** *(Average of values in Figures 2 & 4)* | 64% | 68% |
| **Retrofit Conditions** | Plug existing passive low-flow outlets, add 8" active orifice to riser structure | Plug existing passive low-flow outlets, add 6" active orifice to riser structure |

**Pond 1: Crown Heights**

The Crown Heights pond was modeled assuming a retrofit with an 8-inch continuously modulating valve in place of the three existing low flow orifices. The valve behavior was simulated using forecast-driven control logic which sought to minimize discharge from the site while ensuring sufficient available storage to capture future events, modeled over the 61 year simulation period. The flow-duration results and incremental benefit over the existing condition are shown in Figures 1 and 2, respectively.

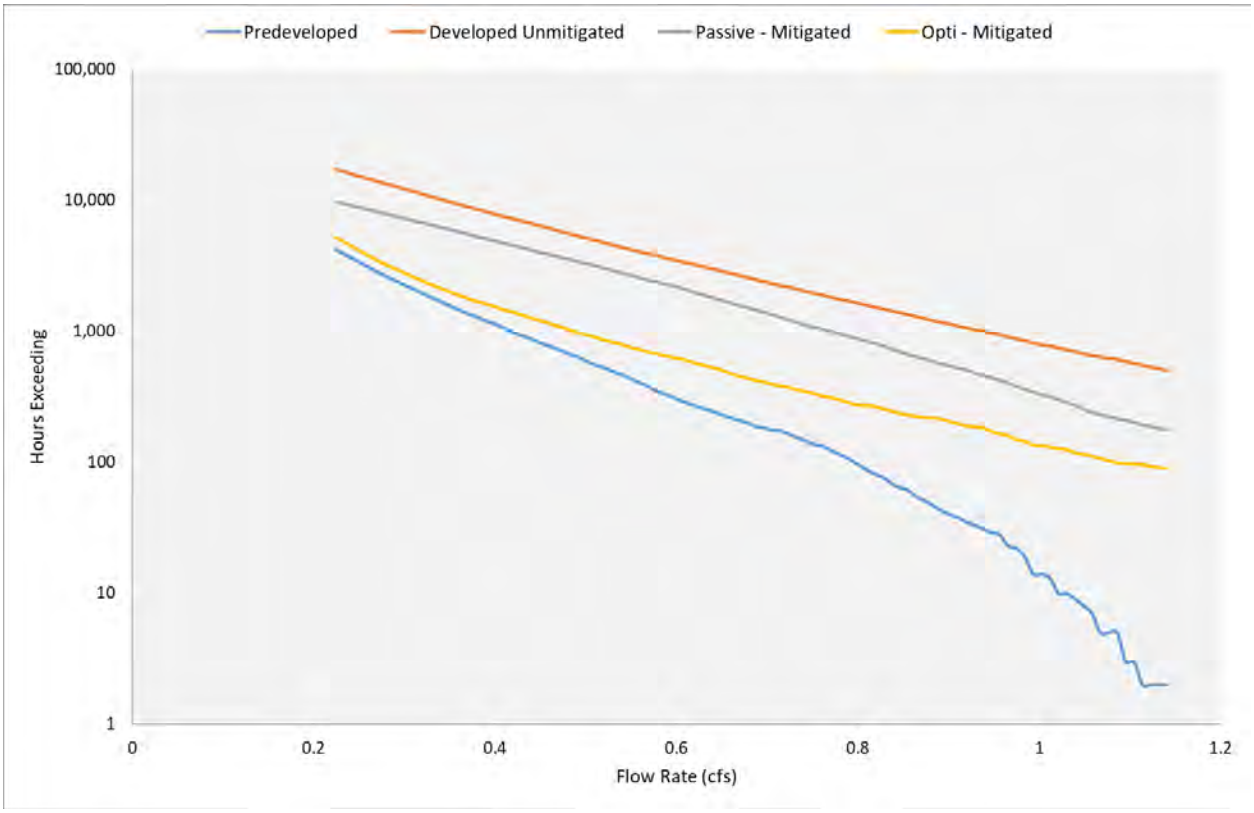

*Figure 1: Flow-Duration Curve for Critical Flow Range at Crown Heights, Various Scenarios.*

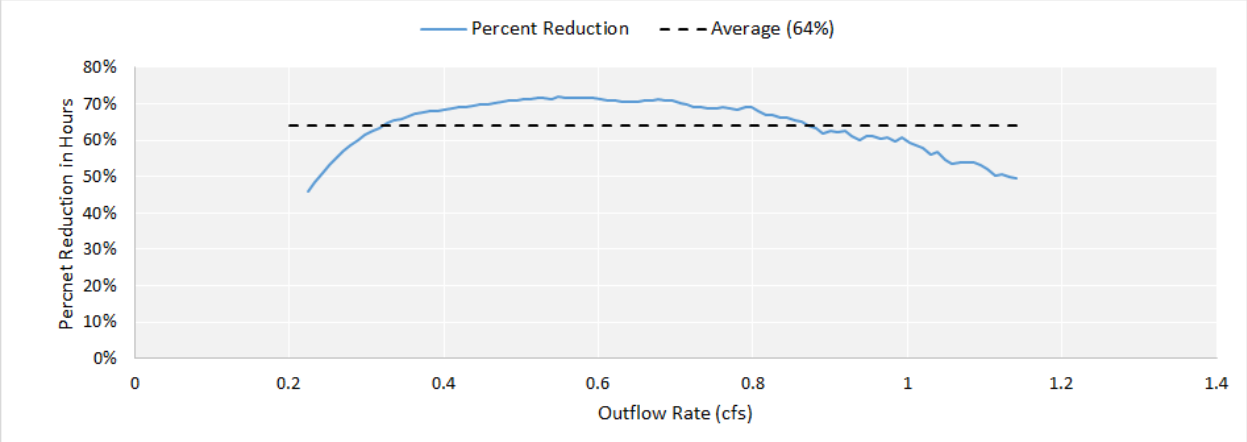

*Figure 2: Incremental Flow Duration Benefit of Active Controls at Crown Heights.*

Across the full range of critical flows, an incremental benefit was observed when comparing the active scenario to existing passive. While the pre-development condition was never achieved, on average a 64% reduction in hours exceeding the critical flows was calculated, showing substantial flow-control improvements.

**Pond 2: Wyndham Knoll**

The Wyndham Knoll facility was modeled using a 6-inch diameter controlled valve replacing the existing series of low-flow orifices in the same configuration as Crown Heights. Durations (hours) of critical flows for all scenarios are shown in Figure 3. While the results of the Opti Mitigated scenario trended closely to the Passive Mitigated for flows less than 0.5cfs, overall a significant improvement was observed with an average of 68% reduction in critical flows across the range (Figure 4).

# Safety Information

- Power must be turned off before servicing, modifying, or maintaining any equipment. Please refer to the de-energizing procedure.
- OptiRTC does not provide warranties for hardware beyond that of the vendor or manufacturer. It is the Owner's responsibility to verify hardware integrity prior to any on-site work.
- Only Qualified Personnel (according to OSHA 1910.332) should conduct electrical work on-site, and all work should conform to national and local electric codes (e.g. NFPA 70).
- Proper confined space entry procedures should be followed at all times when entering confined space outlet structures.

## Contact Information

Contact Opti support or your designated Opti support engineer for online dashboard operation, site management, system operation questions, Opti services, and other support questions.

Email: support@optirtc.com
Phone: (844) 678-4782, Ext. 2

## Necessary Tools

This is a list of tools routinely used for maintenance on Opti hardware.

- Panel key for unlocking the Opti Control Panel.
- Phillips Head screwdriver for opening panels.
- Small slotted 2.5mm screwdriver for changing screw and spring clamp terminal connections.
- Wire strippers and wire clips for installing sensors.
- Multimeter for checking connectivity and voltage. Be sure to understand multimeter use by using online tutorials from electronics websites such as iFixit and SparkFun.
- Soft cloth for cleaning solar panels.
- Bucket for calibrating water level sensors.
- Water depth gage for calibrating water level sensors.

# Introduction

This manual provides guidance for operating and maintaining the hardware for your Opti installation. Opti's active control technology integrates cloud-based software, sensors and flow or volume controls in the field, with the weather forecast to reduce flooding, improve water quality, control combined sewer wet weather flow, and/or restore ecological flow rates in streams.

Each Opti installation is unique and may include hardware not described in this manual. Contact Opti Support for questions about custom hardware maintenance.

**Figure 1:** Opti active control installation

Confidential Information

356 Boylston St, 2nd Floor
Boston, MA 02116
1-844-OPTIRTC
www.optirtc.com

# Hardware Information

The basic Opti active control configuration includes a power source, a control panel, a water level sensor, and a continuous actuator controlling a butterfly valve. Many Opti installations have site-specific hardware, including other sensors and other types of valves. Refer to site drawings for information on your hardware installation and component locations.

## Opti Control Panel

To open the Opti Control Panel, unlock the lock on the panel. Depending on the type of panel, you may need to unlatch latches on the side, turn knobs, or use a large flathead screwdriver to access the swing door and the interior (Figure 2). As a security feature, Opti logs when the panel is accessed by sensing when the door is open or closed. Be sure to close and lock the panel after all on-site maintenance.

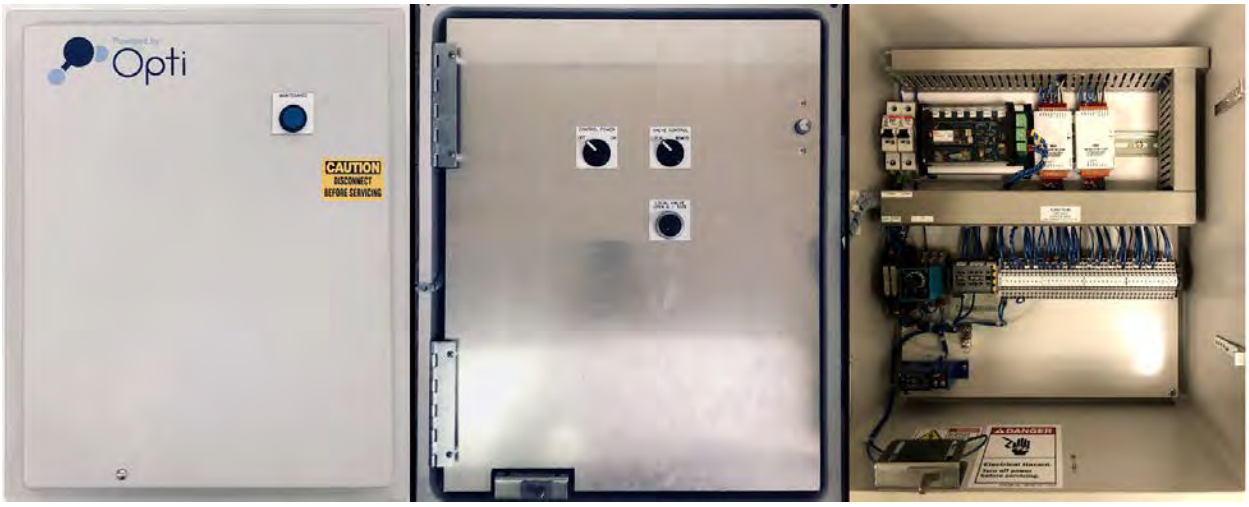

**Figure 2:** Opti Control Panel cover, swing door, and interior (left to right).

### Swing Door

The control panel swing door is shown in Figure 3. The swing door has three switches for cycling power to the control panel, setting manual or remote control, and setting the valve position if the site is in manual mode. Note that the control power switch does not act as a circuit breaker.

## Control Panel Interior

An example control panel is shown in Figure 4. While there may be wiring differences between this example panel and the panel for your site, this image can guide you around the various parts that may be included in your panel. Before electrical maintenance, check the wiring and electrical diagrams prepared for your site.

356 Boylston St, 2nd Floor
Boston, MA 02116
1-844-OPTIRTC
www.optirtc.com

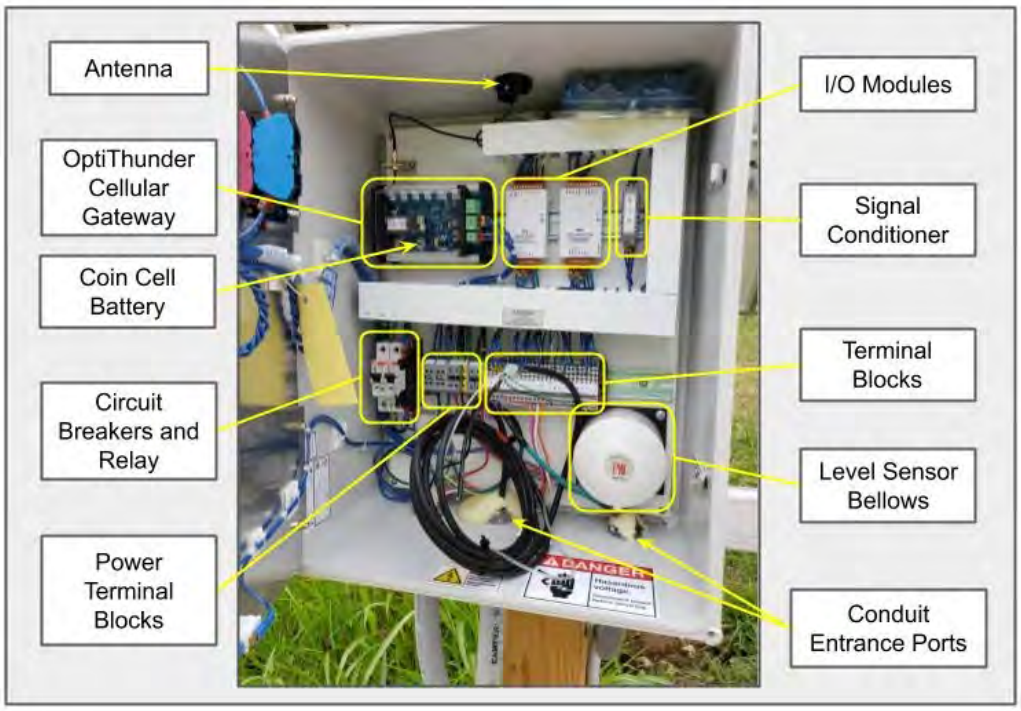

**Figure 4:** Opti control panel annotated with major components

## OptiThunder Cellular Gateway

All electrical components in the control panel are controlled by the OptiThunder cellular gateway. OptiThunder is Opti's proprietary cellular gateway, which connects the panel to the Opti cloud platform. The OptiThunder cellular gateway receives, processes, and sends commands to and from all sources, and maintains failsafe behavior during long offline periods.

## OptiThunder Indicator Lights

The OptiThunder cellular gateway processes all incoming sensor and battery information and connects the panel to the Opti cloud platform. When on site, the status indicator lights will provide the best indication of its behavior. During normal operation, the status light "breathes" cyan by fading in and out softly. Cycling power to the control panel will turn the OptiThunder cellular gateway off and on, and its indicator lights will provide information about its status as it changes (Table 1). There may also be a second, smaller LED that blinks red, which can be ignored.

If the OptiThunder cellular gateway is unable to establish a cloud connection after 5 minutes, power cycle the control panel using its circuit breaker to force OptiThunder to reconnect. If the issue persists contact Opti support staff for further assistance.

© OptiRTC, Inc. 2021. All Rights Reserved.
Confidential Information

**Table 1:** Common status indicator light signals

| LED Color/Behavior | Explanation |
|---|---|
| Flashing Green | Connecting to cellular network |
| Flashing Cyan | Connecting to cloud |
| Breathing Cyan | Successfully connected to cloud |
| Blinking Blue | Check SIM card connection |

### I/O Modules

The I/O modules are used to manage signal inputs and outputs by converting sensor data signals to and from their various protocols. The OptiThunder cellular gateway communicates with the RS485 modbus communication protocol, and the I/O modules convert those signals to and from 4-20 mA and other sensor data signals.

### Panel Circuit Breakers

Circuit breakers are labeled CB1 and CB2. When performing electrical maintenance, make sure both circuit breakers are turned off. CB1 controls power to the panel and CB2 controls power to the actuator.

### Relay

The relay manages timed connections, and cycles power off and on to hardware which is powered on regular intervals.

### Signal Conditioner

The signal conditioner manages the input signals from the manual controls on the swing door. It converts those inputs into 4-20 mA signals before they are read by the I/O modules. Typically, this is used to open and close the valve from the panel, bypassing Opti's online controls.

### Terminal Blocks

Opti uses both screw terminals and spring clamp terminals. To insert or remove wiring to a screw terminal, simply loosen the screw to make changes and tighten the screw after inserting a wire. To insert or remove wiring to a spring clamp terminal, insert a thin, flathead screwdriver into the square hole next to the circular wire terminal. Push the spring clamp outward to open the terminal and insert or remove the wire. After inserting wires, make sure the connection is strong by gently tugging the wire.

© OptiRTC, Inc. 2021. All Rights Reserved.
Confidential Information

### Power Terminal Blocks

The power terminal blocks are standard terminal blocks that are rated for higher voltage and current loads. Connections at these terminals send power to all panel components.

### DIN Rail

The DIN rail is a standard mounting bracket which many components can clip onto. To disconnect a component from the DIN rail, pull out on the component's mounting clip on the bottom rail, and gently lift it off the rail.

### Panel Ground

The panel is electrically grounded at the panel ground to prevent dangerous voltage levels from building up if the panel is electrically damaged.

### Level Sensor Bellows

The level sensor bellows, or pressure reference device, keeps moisture from entering the level sensor's vent tube. This allows the level sensor to reference atmospheric pressure, assisting with the measurements' calibration.

© OptiRTC, Inc. 2021. All Rights Reserved.
Confidential Information

## Valve and Actuator

To control the valve position, the control panel sends power and a 4-20mA signal to an actuator. The actuator then applies torque to the valve to open or close it, and sends a signal back to confirm the position of the valve. During installation, maintenance, or system failure, the valve can be controlled by a human operator. Additional data available for the actuator (added to dashboard by request) includes indicators from the valve manufacturer of potential motion inhibition, valve jammed, or valve obstructed. See the Valve Override Operation Procedures for more information.

**Figure 5:** Example of actuator with manual hand-crank (left) and butterfly valve (right)

## Water Level Sensor

Water level sensors are used as feedback to adapt to changing site conditions. Water level is detected with a pressure transducer which converts pressure into an electrical signal. To minimize error from waves and other disturbances, the pressure transducer is protected in a stilling well.

## Power

Opti hardware can be powered by 120 V AC line power or a 24 V DC battery charged by a solar panel. If line powered, there will be a breaker nearby to disconnect power. If power is lost, a power backup battery will move the valve to a predetermined failsafe position. If the site is solar powered, the batteries will provide this failsafe functionality. Batteries on solar-powered panels are rated for ten days of autonomy on a full charge. However, the

© OptiRTC, Inc. 2021. All Rights Reserved.
Confidential Information

battery will lose charging capacity over time if not connected to the solar power source for longer than 6 months.

# Maintenance Procedures

This section describes operation and maintenance procedures for Opti hardware. In addition to corrective maintenance, all components should be inspected for signs of wear or damage during every site visit or as needed based on site-specific conditions. Refer to Appendix A for an inspection and maintenance log with suggested routine maintenance procedures.

## Routine Maintenance

Site and system component inspection should follow the procedures outlined below, as well as inspection for wear, vandalism, corrosion, or other damage (Table 2). Refer to the manual for each hardware component (provided as separate attachments) for a more complete description of maintenance.

**Table 2:** Recommended routine maintenance procedures

| Component | Maintenance Procedure | Recommended Frequency |
|---|---|---|
| Opti Control Panel | Winterize and dewinterize if needed. Cycle power and replace components if needed. | Annually |
| Coin Cell Battery | Replace coin cell battery on OptiThunder Battery type: CR1220s | Annually |
| Solar Power Kit | Clean solar panels with a soft cloth. Check battery charge. Both batteries should have the same charge. | Biannually |
| Water Level Sensor | Winterize and dewinterize if needed. Visually inspect for obstructions and fouling. Calibrate any time the sensor moves. Check calibration during every site visit. Inspect junction boxes for water damage. | Biannually and during every site visit |
| Rain Gage | Inspect for debris, obstructions, and corrosion. | Biannually and during every site visit |
| Actuator | Clean as needed. Confirm valve calibration. Test battery backup failsafe position. | Biannually and as needed based on email alerts |

© OptiRTC, Inc. 2021. All Rights Reserved.
Confidential Information

| | | |
|---|---|---|
| Valve | Inspect for debris and obstructions. Clean as needed. | Biannually and as needed based on email alerts |
| Gate | Inspect gate and stem for misalignment or damage. Check lubrication, apply lubrication if necessary. Clean stem using brush with stainless steel or brass bristles. Do not use steel bristles or hand grinders. Check for bronze dust or shavings. Replace lift nuts if dust or shavings are found. | Biannually or more depending on use frequency and as needed based on email alerts |
| Trash Rack and Stilling Well | Inspect for debris and obstructions. Clean as needed. Draw down pond if trash rack is submerged. | Biannually and during every site visit |

## Control Panel De-Energizing Procedure

Whenever maintenance is required, the control panel and components must first be de-energized. The steps below outline the de-energizing procedure:

1. Unlock the control panel enclosure and access the swing panel.
2. Turn the Control Power switch to the off position.
3. Open the swing panel. Locate the panel circuit breakers, labeled CB1 and CB2, and turn them down to the off position.

All connected devices are now de-energized and maintenance can proceed. Note that this does not de-energize the input energy source in the site's solar kit or line power connection.

## Valve Override Procedures

There are three procedures to override the valve controls, which ensure reliability during software, connection, hardware, or power failures: online, control panel, and manual override. Generally, online override can be used for remote maintenance while the control panel override is used when on site. During a cellular connection failure, the control panel override can be used. During power failure, the valve can be controlled with a manual override.

1-844-OPTIRTC
www.optirtc.com

## Remote Manual Control

A user with administrative permissions can override the Opti automatic controls of the valve using the online dashboard. Sign into the Opti web portal and navigate to the system control pod in the top left (Figure 6).

1. Change the Operation Mode to Manual Control. Confirm this change with the "Change" button.
2. Enter the desired percent open. Confirm this change with the "Commit" button.
3. When finished manually controlling the valve, set the operation mode back to Automatic Control and confirm with the "Change" button.

Please note that Opti's security features prevent users from making more than one command per four minutes over an online connection. Your commands will take four minutes each to process. An additional rate-limiting security feature prevents the valve from opening fully faster than 20 minutes. It is able to close instantly (as long as it has been four minutes since the most recent command).

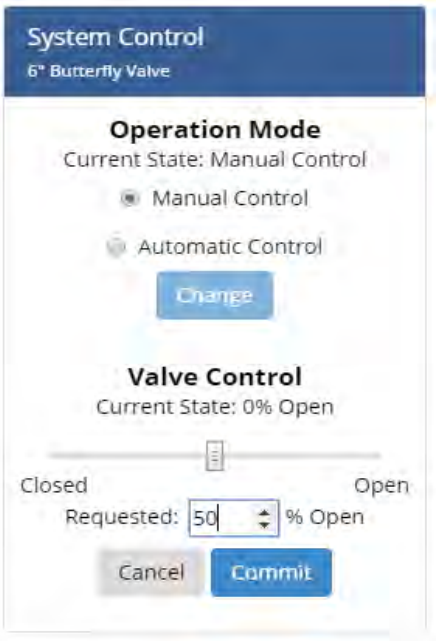

**Figure 6:** System Control pod

## Local Manual Override with Control Panel

When on site, remote control can be overridden with the following procedure:

© OptiRTC, Inc. 2021. All Rights Reserved.
Confidential Information

1. Locate the switch and knob on the swing door labeled “valve control” and “local valve open” (Figure 3).
2. Make sure the “local valve open” knob is set to the desired open percentage.
3. With the system powered on, turn the “valve control” switch to the local position. To make any further changes in local mode, turn the “local valve open” knob to the desired percentage open.
4. Once maintenance is complete, set the “local valve open” knob back to 0% open and turn the “valve control” switch to the remote position, so that Opti can continue to autonomously control the hardware.

### Local Manual Override with Hand Crank

To physically operate the valve using the hand crank, follow this procedure:

1. Follow the Control Panel De-Energizing Procedure to turn power off.
2. Turn the handle on the actuator until the butterfly valve is at the desired set point. The valve position is reported on the screen of the actuator.

## Actuator Calibration

To check the calibration of the actuated valve, follow this procedure:

1. Use remote manual control to place the valve into the fully open position. Once the valve is fully open, record the time.
2. Command the valve to 50% open. When the valve stops moving, record the time. Note that the valve will be at an angle greater than 45°, since we are calculating percent area open.
3. Put the valve in the fully closed position (0% open). When you can see the valve is fully closed, record the time.
4. Contact Opti Support and send the three recordings of time and target positions.

## Battery Back-up Failsafe Position Confirmation

The battery back-up failsafe position needs to be confirmed during routine site visits. To test this, de-energize the control panel using the process described above. Record the position of the valve (usually either fully closed or fully open) and report this position to Opti Support.

## Water Level Sensor Calibration

Water level sensors may need to be calibrated after: installation, dewinterization, re-location of sensors, or when data shown on the dashboard does not match observed

© OptiRTC, Inc. 2021. All Rights Reserved.
Confidential Information

values. All calibration is done through Opti software and requires no hardware changes. To take calibration measurements, follow this procedure:

1. Place the water level sensor in a bucket of water.
2. De-energize the Opti Panel using the power switch.
3. Measure the depth of the sensing element at the end of the pressure transducer.
4. Turn the Opti Panel back on and wait until the status indicator light breathes cyan. This indicates that a pressure is being recorded and sent to Opti. Record both the time of the measurement and the depth of water.
5. Place the water level sensor in its final position in the body of water, and repeat steps 2-4 to record the sensor depth and time. Do not move the sensor afterwards.
6. Measure the distance between the water surface elevation and a known elevation such as a valve elevation, and record the time.
7. Contact Opti Support and send the three pairs of time and elevation measurements.

# Winterization and Dewinterization

Winterization may be necessary if a site encounters freezing temperatures during winter months. Winterization is done to avoid damage to sensors caused by expansion of freezing water. Sites may not need winterization if sensors are installed deep enough where water does not freeze. A typical winterization and dewinterization process follows the steps below.

## Winterization

1. Follow the control panel valve override procedure and place the valve in your site's failsafe position using the valve open percentage dial while in local control mode.
2. Remove the sensor from the water and store it at an elevation where it will not be submerged. The sensor(s) may be attached with zip ties, with any extra cable looped neatly. This is recommended for pressure transducers, TSS sensors, and multiparameter sensors, which may be damaged by freezing water.
3. Once you have locked the site again, notify Opti support via email or phone that the site has been winterized.

## Dewinterization

1. Replace all sensors in their original location in the water.
2. Follow the procedure described in Water Level Sensor Calibration by recording two water level sensor depths and times, and a reference elevation.
3. Notify Opti Support that the site is now dewinterized. Include water level sensor calibration measurements.

© OptiRTC, Inc. 2021. All Rights Reserved.
Confidential Information

4. Place the site from manual mode into auto mode.
5. Monitor the site for one week or until the first rain event to ensure it is functioning correctly.

## Coin Cell Battery Replacement

The coin cell battery on the OptiThunder cellular gateway helps preserve information about the device's state and configuration during power outages to the device. We recommend replacing it once a year. Available at Home Depot or similar. See example at right.

In order to replace the battery, remove the plastic cover over the OptiThunder by pulling directly away from the device. The coin cell is located in the bottom-right corner. Carefully remove the existing battery and replace it with the new one. Ensure it is replaced in the same orientation (+ side facing out).

# Troubleshooting

Troubleshooting involves identifying an issue and performing corrective maintenance on an unknown problem. Troubleshooting becomes much easier with a good understanding of dependencies within the Opti active control system and the correct tools to detect where failures may be occurring.

## Dependency Flow Diagram

The diagram shown in Figure 7 is a simplified view of the flow of information and power through various components. An arrow indicates a direct dependency, in which information or power may flow between components. This diagram can be used to help find, diagnose, and repair problems either remotely or on site.

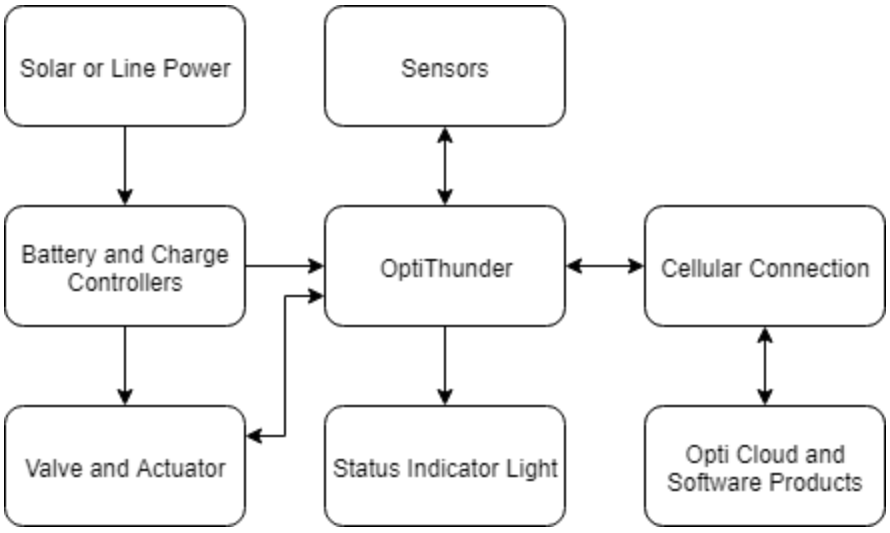

**Figure 7:** Dependency flow diagram

## Triggers for Maintenance

By providing real-time data online on the Opti Dashboard, indicators of maintenance needs can be observed remotely. Please see below for some examples of unusual data patterns (observed on the Opti Dashboard) that indicate when maintenance is required: Valve Clog, Pressure Transducer Electrical Failure, and I/O Module Disconnection.

# Opti Dashboard Troubleshooting Examples

## Valve clog

In this example, a valve was stuck at approximately 18% open and would not follow any further valve commands (Figure 8). This was caused by a clog which prevented the valve (blue) from opening to its target state. The valve flatlined, and didn't respond to further commands. Once it was placed in online override mode and opened further, the valve opened and the clog was released. It was immediately returned to automatic mode and showed normal behavior during a drawdown period the next day.

If a valve's percentage open is more than 5% different from its target state, this is often due to a clog preventing further valve movement. Clogs are often resolved by placing the valve in manual mode and sending commands to fully open and close. These commands will send a larger amount of torque to the valve and likely clear any present clogs. If the issue persists, go on site and perform a Control Panel Override on site to clear the clog. If problems persist, contact Opti Support to help determine the cause.

**Figure 8:** Opti dashboard during a valve clog

Confidential Information

356 Boylston St, 2nd Floor
Boston, MA 02116
1-844-OPTIRTC
www.optirtc.com

## Pressure Transducer Electrical Failure

In this example, the water level sensor PT3 (orange) frequently spikes to the high end of its range (Figure 9). Since the sensor outputs an electrical signal, it appears that electrical components may be short-circuited. This sensor shows this behavior intermittently and may be irreparably damaged. To troubleshoot water level sensor issues, follow routine maintenance procedures by checking all connections to the sensor, cleaning dirt and debris, and checking the desiccant. If the problem continues, replace the sensor.

Boston, MA 02116
1-844-OPTIRTC
www.optirtc.com

## I/O Module disconnection

In this example, all of one site's pressure transducers showed a loss of connection at the same time on August 10 (Figure 10). However, the internet connection remained online. This failure happened due to a disconnection from one of the I/O modules. Since the wire terminal on one side of the I/O module does not screw in to protect it from coming loose, it may disconnect if the wiring is too tight and pulls it away. Wiring may disconnect across many panel components; to ensure reliable wiring, gently tug all wire and terminal connections when installing and changing connections.

# King County
# Stormwater Services Section
# FMD Tax Parcel Water Quality Inspections

Parcel Name: Tr B - Redmond SP (SPL 98-007), APN2526059203 WQ File No 2017-0097

Date: 5/5/2017

Inspector: A. Jones

Parcel Identification 2526059203

Facility Identification n/a

## 1. Stormwater System Components

**A) Outfalls (to or from property)**
Two outfalls on or near property line. Two 12" HDPE tightlines from a City of Redmond flow control pond and overflow.

**B) Conveyance (ditches, swales, pipes, catch basins/structures)**
Two 12" HDPE tightlines from an adjacent City of Redmond flow pond and overflow cross the property south to north.

**C) Flow control facility**
None.

**D) Water quality facility**
None.

## 2. Illegal Waste Disposal

**A) Solid waste (automobiles, trash construction debris)**
None observed.

**B) Liquid waste (staining, dead vegetation, sheen)**
None observed.

**C) Other waste disposal issues (e.g., hazardous materials, unknown drums, meth labs)**
None observed.

## 3. Trespass

**A) Structures**
None observed.

**B) Landscaping/clearing/grading (lawn, parking areas)**
None observed.

**C) Illegal encampments (occupation)**
None observed.

**D) Other trespass issues**
None observed.

## 4. Erosion

**A) Sources observed?**
None observed.

**B) Turbidity entering or leaving property?**
None observed.

**C) Potential human-caused or natural?**
n/a

## 5. Other Water Quality Issues

None observed. A stream crosses the northwest corner of the parcel. The parcel is located in a designated erosion senstive area and wetland.

## 6. Water Quality Compliance Status and Corrective Actions (if applicable)

**In compliance, no further action required**

Remarks / Action Items: - MS4 conveyance serving a City of Redmond flow control facility crosses the property and outfalls near the northern property line (two parallel above ground 12" HDPE pipes). These outfalls discharge to a rock pad upgradient of the stream.
- No MS4 on the parcel to inspect or maintain annually per the permit.
- Wooded undeveloped parcel on a slope (south to north) with stream crossing a portion of parcel.
- Erosion senstive area and wetland.
- No WQ issues observed during the site visit.

**7. Site Photos**

Photo 1: Looking northeast at the parcel.

Photo 2: View looking north-northwest down the slope.

Photo 3: Looking east-northeast at the parcel at the slope.

Photo 4: The two 12" HDPE pipes crossing the parcel.

Photo 5: Outfall area of the two 12" pipes.

Photo 6: Looking toward the stream crossing the parcel.

Photo 7: Another view looking northeast toward the stream.

**8. Site Sketch or Map Including Outfalls and Components**

Aerial view of parcel with photopoints (2015 aerial photograph).

# OptiRTC CMAC Functional Equivalency

STATE OF WASHINGTON
DEPARTMENT OF ECOLOGY
*PO Box 47600 • Olympia, WA 98504-7600 • 360-407-6000*
*711 for Washington Relay Service • Persons with a speech disability can call 877-833-6341*

November 1, 2018

Mr. Marcus Quigley, P.E.
Chief Executive Officer
OptiRTC Inc.
356 Boylston Street, 2nd Floor
Boston, MA 02116

**RE: Continuous Monitoring and Adaptive Control (CMAC) Functional Equivalency to Detention Pond Outlet Structures**

Dear Marcus Quigley:

The Washington State Department of Ecology (Ecology) finds that the OptiRTC Continuous Monitoring and Adaptive Control (CMAC) system for hydraulic control of stormwater facilities is functionally equivalent to the standard outlet control structure for wet ponds, retention ponds, and detention ponds as described in the Stormwater Management Manual for Western Washington (SWMMWW) and the Stormwater Management Manual for Eastern Washington (SWMMEW).

OptiRTC CMAC is a control approach for stormwater facilities that can be designed to conform to various design criteria. This approach does not inherently confer a certain level of service; therefore, Opti has developed a CMAC analysis tool (current version is an Excel-based extension to the Western Washington Hydrology Model (WWHM)). The Opti CMAC system must be designed using the analysis tool and must adhere to the guidelines in the manufacturers specifications. Project applicants seeking to use Opti CMAC and the CMAC-WWHM Tool must obtain design input from OptiRTC regarding Tool application and system design. Designs without detailed input from OptiRTC are not acceptable and may not be installed.

Ecology cannot endorse this product or its manufacturer. Contractors may use the Opti CMAC without seeking additional Ecology approval, however Ecology is tracking the installations of the Opti CMAC system. Local governments with a National Pollutant Discharge Elimination System (NPDES) permit shall submit the enclosed Notice of Intent Form to Ecology when installing the Opti CMAC. All other jurisdictions are also encouraged to notify Ecology when installing the Opti CMAC.

If you have questions, please contact me at your earliest convenience at (360) 407-6444 or douglas.howie@ecy.wa.gov.

Sincerely,

Douglas C. Howie, P.E.
Stormwater Engineer

## REQUIRED SUBMITTALS:

1. SHOP DRAWINGS FOR THE TWO CORRUGATED ALUMINUM OUTLET RISERS (ONE PER PROJECT SITE).
2. STRUCTURAL CALCULATIONS FOR THE VALVE SUPPORT (DETAIL 3 ON SHEET C3.03).

## GENERAL NOTES:

1. ALL DESIGN AND CONSTRUCTION SHALL BE IN ACCORDANCE WITH PERMIT CONDITIONS, THE KING COUNTY CODE (KCC), ROAD STANDARDS (KCRS), WASHINGTON STATE DOT (WSDOT) STANDARD SPECIFICATIONS AND THE CONDITIONS OF PRELIMINARY APPROVAL. IT SHALL BE THE SOLE RESPONSIBILITY OF THE APPLICANT AND THE PROFESSIONAL CIVIL ENGINEER TO CORRECT ANY ERROR, OMISSION, OR VARIATION FROM THE ABOVE REQUIREMENTS FOUND IN THESE PLANS. ALL CORRECTIONS SHALL BE AT NO ADDITIONAL COST OR LIABILITY TO KING COUNTY.

2. THE DESIGN ELEMENTS WITHIN THESE PLANS HAVE BEEN REVIEWED ACCORDING TO THE KING COUNTY DEPARTMENT OF DEVELOPMENT AND ENVIRONMENTAL SERVICES (DDES) ENGINEERING REVIEW CHECKLIST. SOME ELEMENTS MAY HAVE BEEN OVERLOOKED OR MISSED BY THE DDES PLAN REVIEWER. ANY VARIANCE FROM ADOPTED STANDARDS IS NOT ALLOWED UNLESS SPECIFICALLY APPROVED BY KING COUNTY PRIOR TO CONSTRUCTION.

3. APPROVAL OF THIS ROAD, GRADING, PARKING AND DRAINAGE PLAN DOES NOT CONSTITUTE AN APPROVAL OF ANY OTHER CONSTRUCTION (E.G. DOMESTIC WATER CONVEYANCE, SEWER CONVEYANCE, GAS, ELECTRICAL, ETC.)

4. A COPY OF THESE APPROVED PLANS MUST BE ON THE JOB SITE WHENEVER CONSTRUCTION IS IN PROGRESS.

5. GRADING ACTIVITIES (SITE ALTERATION) ARE LIMITED TO THE HOURS OF 7 A.M. TO 7 P.M. MONDAY THROUGH SATURDAY AND 10 A.M. TO 5 P.M. ON SUNDAY, UNLESS OTHERWISE APPROVED WITH A WRITTEN DECISION BY THE REVIEWING AGENCY.

6. IT SHALL BE THE APPLICANT'S/CONTRACTOR'S RESPONSIBILITY TO OBTAIN ALL CONSTRUCTION EASEMENTS NECESSARY BEFORE INITIATING OFF-SITE WORK. EASEMENTS REQUIRE REVIEW AND APPROVAL PRIOR TO CONSTRUCTION.

7. DATUM SHALL BE KCAS UNLESS OTHERWISE APPROVED BY DDES.

8. ALL UTILITY TRENCHES AND ROADWAY SUBGRADE SHALL BE BACKFILLED AND COMPACTED TO 95 PERCENT DENSITY, STANDARD PROCTOR.

9. OPEN CUTTING OF EXISTING ROADWAYS FOR NON-FRANCHISED UTILITY OR STORM WORK IS NOT ALLOWED UNLESS SPECIFICALLY APPROVED BY DDES AND NOTED ON THESE APPROVED PLANS. ANY OPEN CUT SHALL BE RESTORED IN ACCORDANCE WITH KCRS.

10. THE CONTRACTOR SHALL BE RESPONSIBLE FOR PROVIDING ADEQUATE SAFEGUARDS, SAFETY DEVICES, PROTECTIVE EQUIPMENT, FLAGGERS, AND ANY OTHER NEEDED ACTIONS TO PROTECT THE LIFE, HEALTH, AND SAFETY OF THE PUBLIC, AND TO PROTECT PROPERTY IN CONNECTION WITH THE PERFORMANCE OF WORK COVERED BY THE CONTRACTOR. ANY WORK WITHIN THE TRAVELED RIGHT-OF-WAY THAT MAY INTERRUPT NORMAL TRAFFIC FLOW SHALL REQUIRE AT LEAST ONE FLAGGER FOR EACH LANE OF TRAFFIC AFFECTED. MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES (MUTCD) SHALL APPLY. WORK IN RIGHT-OF-WAY IS NOT AUTHORIZED UNTIL A TRAFFIC CONTROL PLAN IS APPROVED BY KING COUNTY.

## EROSION CONTROL NOTES:

1. ALL LAND DISTURBING ACTIVITIES SHALL OCCUR BETWEEN JUNE 1 AND SEPTEMBER 30.

2. ANY AREAS OF EXPOSED SOILS, INCLUDING ROADWAY EMBANKMENTS, THAT WILL NOT BE DISTURBED FOR TWO DAYS DURING THE WET SEASON OR SEVEN DAYS DURING THE DRY SEASON SHALL BE IMMEDIATELY STABILIZED WITH DOT MULTIPURPOSE GRASS SEED MIX AVAILABLE FROM SUNMARK SEEDS. APPLY SEED, MULCH, AND SLOW RELEASE FERTILIZER AS RECOMMENDED BY SUNMARK SEEDS.

3. PRIOR TO THE BEGINNING OF THE WET SEASON (OCT. 1), ALL DISTURBED AREAS SHALL BE REVIEWED TO IDENTIFY WHICH ONES CAN BE SEEDED IN PREPARATION FOR THE WINTER RAINS. DISTURBED AREAS SHALL BE SEEDED WITHIN ONE WEEK OF THE BEGINNING OF THE WET SEASON. A SKETCH MAP OF THOSE AREAS TO BE SEEDED AND THOSE AREAS TO REMAIN UNCOVERED SHALL BE SUBMITTED TO THE DDES INSPECTOR FOR REVIEW.

## NOTE AND DETAIL/SECTION REFERENCING

2. ACTUATOR TO BE ORIENTED WITH WHEEL FACING AWAY FROM WALL. VALVES SHALL REST ON APPROVED STRUCTURE FIT TO BEAR 600LB LOAD.
3. IP68 CORD GRIP REQUIRED FOR CONNECTION BETWEEN WIRE AND CONTROL PANEL. ALL CONDUIT CONNECTIONS TO BE IP68 RATED AND SEALED WITH POLYWATER FOAM DUCT SEALANT. CONDUIT TO BE SIZED BY CONTRACTOR. ACTUATOR CONDUIT PORT IS $\frac{3}{4}$ IN. INTERNAL THREADED, DOWNSIZE CONDUIT IF NEEDED. CONDUIT ALONG WALL TO BE SECURED WITH #304 SS CLIPS (3' SPACING MAXIMUM).
4. CONTRACTOR TO ENSURE FLANGE AND VALVE ARE COMPATIBLE. FLANGE BOLTS SHALL BE #304 STAINLESS STEEL AND BE TIGHTENED TO THE TORQUE SETTINGS RECOMMENDED BY THE VALVE MANUFACTURER.
5. FLANGE TO WALL CONNECTION: BOLT CAVITIES TO BE CLEANED OF DEBRIS USING AUTO CLEANING DRILL BIT OR COMPRESSED AIR PRIOR TO ANCHORING. BOLT CAVITIES TO BE FILLED WITH INJECTABLE ADHESIVE ANCHOR (HILTI HIT SERIES EPOXY #2123401 OR EQUIVALENT). BOLTS TO BE EMBEDDED TO MINIMUM DEPTH SPECIFIED BY MANUFACTURER, 1 IN. CLEARANCE FROM REBAR.
6. PROVIDE AT LEAST ONE 3 X 0.090 GAUGE SUPPORT BRACKET ANCHORED TO CONCRETE WALL WITH 5/8 IN. STAINLESS STEEL EXPANSION BOLTS OR EMBEDDED SUPPORTS 2 IN. INTO M/H WALL (VERTICAL SPACING).

PROFILE VIEW PLAN VIEW

NOTES:

1. OPTI SPECIFIED EQUIPMENT (KING COUNTY WILL PROCURE AND PROVIDE TO CONTRACTOR):
   - 1.1. VALVE STEM EXTENSION (DELIVERED WITH VALVE)
   - 1.2. 12" x 1 5/8 IN. STRUT CHANNEL
   - 1.3. 18" x ½ IN. ANCHOR RODS (2 PER STRUT)
   - 1.4. STRUT-MOUNT ROUTING CLAMPS (2 PER STRUT)
2. ALL BRACKET MATERIALS MUST BE #304 STAINLESS STEEL.
3. MINIMUM SPACING: 1 VALVE STEM MOUNT FOR STEM LENGTH BELOW 3 FEET. ADD VALVE STEM MOUNTS PER ADDITIONAL 3 FEET OF STEM LENGTH.
4. ½ IN. ANCHOR ROD TO BE SET USING INJECTABLE ADHESIVE ANCHOR WITH AUTO CLEANING DRILL BIT OR CLEAN HOLE THOROUGHLY WITH COMPRESSED AIR. USE QUIKRETE HIGH STRENGTH ANCHORING EPOXY (PRODUCT #8620-31) OR EQUIVALENT. ROD SET IN CONCRETE MIN 3 IN..

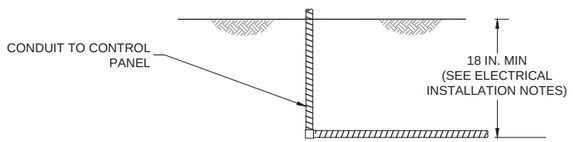
NOTES:



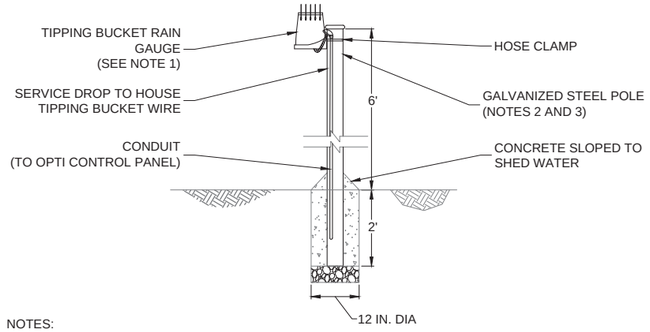
1. OPTI SPECIFIED EQUIPMENT (KING COUNTY WILL PROCURE AND PROVIDE TO CONTRACTOR):
   - 1.1. WATER LEVEL SENSOR
   - 1.2. POLYWATER FOAM DUCT SEALANT (SENT WITH OPTI CONTROL PANEL)

   ALL OTHER EQUIPMENT TO BE PROCURED BY INSTALLATION CONTRACTOR.
2. WATER LEVEL SENSOR TO REST WITHIN PVC STILLING WELL. SENSOR TO REST AT BOTTOM OF FACILITY OR AT SPECIFIED MINIMUM ELEVATION.
3. OPTI-SPECIFIED JUNCTION BOX REQUIRED IF CABLE LENGTH EXCEEDS 100 FT. JUNCTION BOX LOCATION TO BE SPECIFIED BY OPTI. BOTTOM OF JUNCTION BOX TO BE MOUNTED AT LEAST 4 IN. ABOVE OVERFLOW ELEVATION.
4. PENETRATIONS INTO ALL EQUIPMENT AND CONNECTIONS WITHIN JUNCTION BOXES SHALL BE IP68 RATED AND SEALED WITH POLYWATER FOAM DUCT SEALANT. SEE ELECTRICAL DIAGRAM FOR CABLE AND CONDUIT SPECIFICATION.
5. CONDUIT SECURED ON WALL WITH STAINLESS STEEL CLIPS (3' MAX SPACING). PVC STILLING WELL TO BE SECURED WITH STAINLESS STEEL PIPE STRAPPING (24 IN. MAX SPACING).
6. PRESSURE REFERENCE DEVICE TO BE LOCATED IN OPTI CONTROL PANEL. DO NOT SPLICE WATER LEVEL SENSOR CABLE.
7. MINIMUM 1 FOOT SPARE CABLING TO BE NEATLY COILED IN CONTROL PANEL FOR FUTURE MAINTENANCE OR SYSTEM MODIFICATIONS.

## WATER LEVEL SENSOR DETAIL (PRESSURE TRANSDUCER) WALL MOUNTED

SCALE: NTS

1 / C3.01



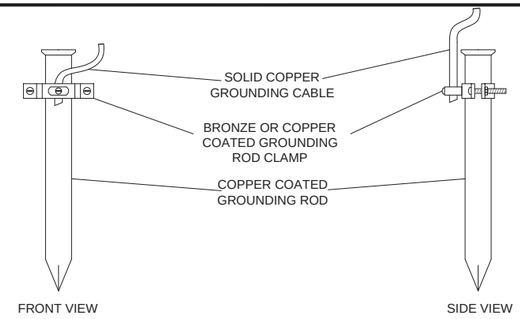
NOTES:

1. BURIED CONDUIT SHALL BE RIGID SCH 40 PVC
2. ALL CONDUIT PENETRATIONS ARE TO BE IP68 RATED.
3. REPLACED SOIL SHALL BE COMPACTED TO AT LEAST 95% OF ASTM D698.
4. AFTER BACKFILL STABILIZE SURFACE WITH DOT MULTIPURPOSE GRASS SEED MIX AVAILABLE FROM SUNMARK SEEDS. APPLY SEED, MULCH, AND SLOW RELEASE FERTILIZER AS RECOMMENDED BY SUNMARK SEEDS.

## CONDUIT BURIAL DETAIL

SCALE: NTS

5 / C2.01



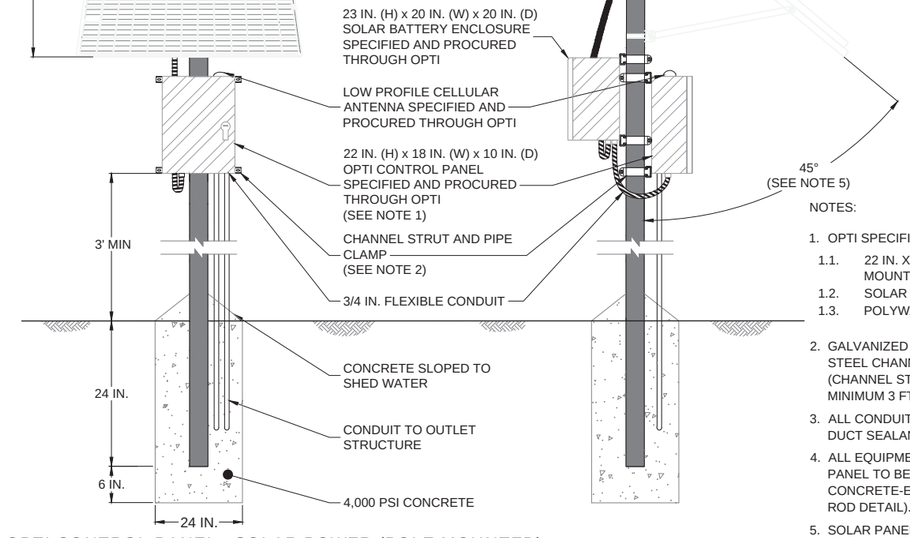
NOTES:

1. MOUNT TIPPING BUCKET RAIN GAUGE PER MANUFACTURERS INSTRUCTIONS.
2. TIPPING BUCKET MOUNT KIT COMES WITH U-BOLT TO FIT A 1.25 IN.-1.75 IN. POLE. CAN ALSO BE MOUNTED TO A 2.5 IN. POLE.
3. TIPPING BUCKET CAN BE MOUNTED ON ANY EXPOSED FREE STANDING POLE OR SURFACE ON SITE.
4. RAIN GAUGE SHOULD BE SITED SUCH THAT SURROUNDING OBJECTS ARE NO CLOSER THAN TWO TIMES THEIR HEIGHT ABOVE THE GAUGE.
5. ALL CONDUIT PENETRATIONS ARE TO BE IP68 RATED.

## RAIN GAUGE

SCALE: NTS

2 / C2.01



NOTES:

1. GROUNDING ROD TO BE MINIMUM COPPER COATED, 8 FT LENGTH, $\frac{3}{4}$ DIAMETER
2. GROUNDING ROD CLAMP TO BE BRONZE OR COPPER COATED AND SIZED FOR GROUNDING CABLE
3. GROUNDING CONDUCTOR TO BE SOLID COPPER, 12 AWG TO 2 AWG, AND SECURELY LANDED AT GROUNDING ROD CLAMP AND CONTROL PANEL GROUNDING LUG
4. ALL PENETRATIONS IN CONTROL PANEL TO BE 1P68 RATED
5. MAXIMUM 6 IN OF GROUNDING ROD EXPOSED ABOVE GROUND

## GROUNDING ROD DETAIL

**ELECTRICAL INSTALLATION NOTES**

1. DETERMINE IF THERE ARE UNDERGROUND UTILITIES IN THE WORK AREA PRIOR TO EXCAVATION, BY CALLING DIG SAFE AT LEAST 48 HOURS PRIOR TO STARTING WORK. CONTRACTOR SHALL BE LIABLE FOR ANY DAMAGE TO UNDERGROUND UTILITIES CAUSED BY TRENCHING OR EXCAVATION.
2. INSTALLATION OF THE CONTROL PANEL AND ASSOCIATED COMPONENTS (E.G., CABLING, CONDUIT, SENSORS) MUST BE PERFORMED BY A LICENSED ELECTRICIAN. ELECTRICIAN SHALL BE RESPONSIBLE FOR ENSURING THAT THE CONTROL PANEL AND ASSOCIATED COMPONENTS ARE PROPERLY CONNECTED TO THE SOLAR POWER SYSTEM AND THAT CONDUIT AND CABLING IS SIZED AND INSTALLED PER THE NEC.
3. ALL CONDUCTORS SHALL BE IDENTIFIED AT EACH END (LABELED OR COLOR CODED) AND THE IDENTIFIED CONDUCTORS DOCUMENTED IN THE SITE LAYOUT MAP.
4. PENETRATIONS INTO CONTROL PANEL MUST BE IP68 RATED (NO WATER SHALL PENETRATE ANY SEALS). SUBSURFACE TERMINATIONS SHALL BE SEALED WITH POLYWATER CLOSED-CELL FOAM DUCT SEALANT (PROCURED THROUGH OPTI WITH CONTROL PANEL).
5. REFERENCE "ACTUATOR POWER CABLE AWG SPECIFICATIONS" TABLE FOR THE CORRECT CONDUCTOR GAUGE FOR ACTUATOR POWER CONNECTIONS. ALL OTHER CONDUCTORS MUST BE AT LEAST 16AWG.
6. ALL BURIED CONDUIT RUNS SHALL BE RIGID SCH 40 PVC CONDUIT. ALL EXPOSED CONDUIT SHALL BE RIGID SCH 40 PVC OR FLEXIBLE TYPE-UA PVC. BURIED RIGID SCHEDULE 40 CONDUIT SHALL BE INSTALLED WITH A MINIMUM COVER OF AT LEAST 18" IN ACCORDANCE WITH TABLE 300.5 OF THE NEC.
7. CONDUIT SHALL BE SIZED PER THE NEC TO HAVE AN ADEQUATE CROSS-SECTIONAL AREA FOR INSTALLED CABLES. REFERENCE OPTI PROVIDED TABLE FOR MINIMUM CONDUIT SIZE. ACTUATOR HAS ¾" PORTS FOR CONDUIT, USE REDUCING FITTING IF NEEDED.
8. LEAVE A MINIMUM OF 1 FOOT SPARE CABLING NEATLY COILED IN CONTROL PANEL FOR FUTURE MAINTENANCE OR SYSTEM MODIFICATIONS.
9. LEAVE A MINIMUM 3 FEET LOOP OF FLEXIBLE CONDUIT IN OUTLET STRUCTURE FOR EASE OF FUTURE MAINTENANCE. FLEXIBLE CONDUIT SHALL RUN FROM ACTUATOR TO JUNCTION BOX LOCATED IN OUTLET STRUCTURE. RIGID CONDUIT SHALL RUN FROM JUNCTION BOX TO OPTI CONTROL PANEL.
10. ALL SUBMERGED/SATURATED METAL HARDWARE SHALL BE STAINLESS STEEL. GALVANIZED STEEL MAY BE USED ABOVEGROUND OR IN DRY LOCATIONS.
11. PRESSURE REFERENCE DEVICE (COMPONENT OF LEVEL SENSOR AT CABLE TERMINATION) TO BE LOCATED IN OPTI CONTROL PANEL. USE LABELING SCHEME DICTATED ON ELECTRICAL SCHEDULE.
12. CONNECT ALL EQUIPMENT GROUNDING CONDUCTORS TO THE OPTI CONTROL PANEL GROUNDING LUGS. GROUND THE OPTI CONTROL PANEL TO A GROUNDING ROD, GALVANIZED STEEL POLE, OR A CONCRETE-ENCASED GROUNDING ELECTRODE.
13. AFTER INSTALLATION, COMPLETE CONTRACTOR INSTALLATION CHECKLIST PROVIDED BY OPTI AND PROVIDE PHOTOS OF ALL INSTALLED EQUIPMENT. SEND SIGNED CHECKLIST AND PHOTOS TO OPTI.
14. OPTI WILL INSPECT INSTALLED COMPONENTS PRIOR TO ENERGIZING THE SYSTEM. FINAL COMPLETION SHALL BE REACHED WHEN: (1) CONSTRUCTION OF THE SYSTEM PER THE PLANS IS COMPLETE; (2) THE ENGINEER OF RECORD HAS COMPLETED FINAL INSPECTION OF WORK AND ALL NOTED DEFICIENCIES HAVE BEEN CORRECTED TO THE SATISFACTION OF THE ENGINEER OF RECORD, OPTI, AND THE SITE OWNER; AND (3) AN AS-BUILT SKETCH HAS BEEN PROVIDED OF ALL INSTALLED COMPONENTS IF FINAL INSTALL LOCATIONS HAVE VARIED FROM PLANSET.

# TECHNICAL MEMORANDUM

**Date:** August 8, 2022

**To:** Matt McNair, PE, Water Quality Program Manager
Water and Land Resources Division, King County DNRP

**From:** Christopher Webb, PE, Herrera Environmental Consultants

**Subject:** Technical Information Report Supplement
Bear Creek CMAC Retrofit

## INTRODUCTION

This Technical Memorandum is issued as a supplement to the Final Technical Information Report for the Bear Creek CMAC Retrofit dated May 31, 2022. The purpose of this supplement is to discuss the additional requirements that will apply if the construction occurs in the wet season (October 1 – April 30). Originally the project has been planned to complete construction prior to September 30.

The following sections replace the corresponding section of the above referenced TIR.

cw—tir_supplement_22-0728 .docx

# TECHNICAL INFORMATION REPORT (TIR) WORKSHEETS

This revised part 13 should replace the corresponding sections in both the Crown Heights and Wyndham Knoll projects.

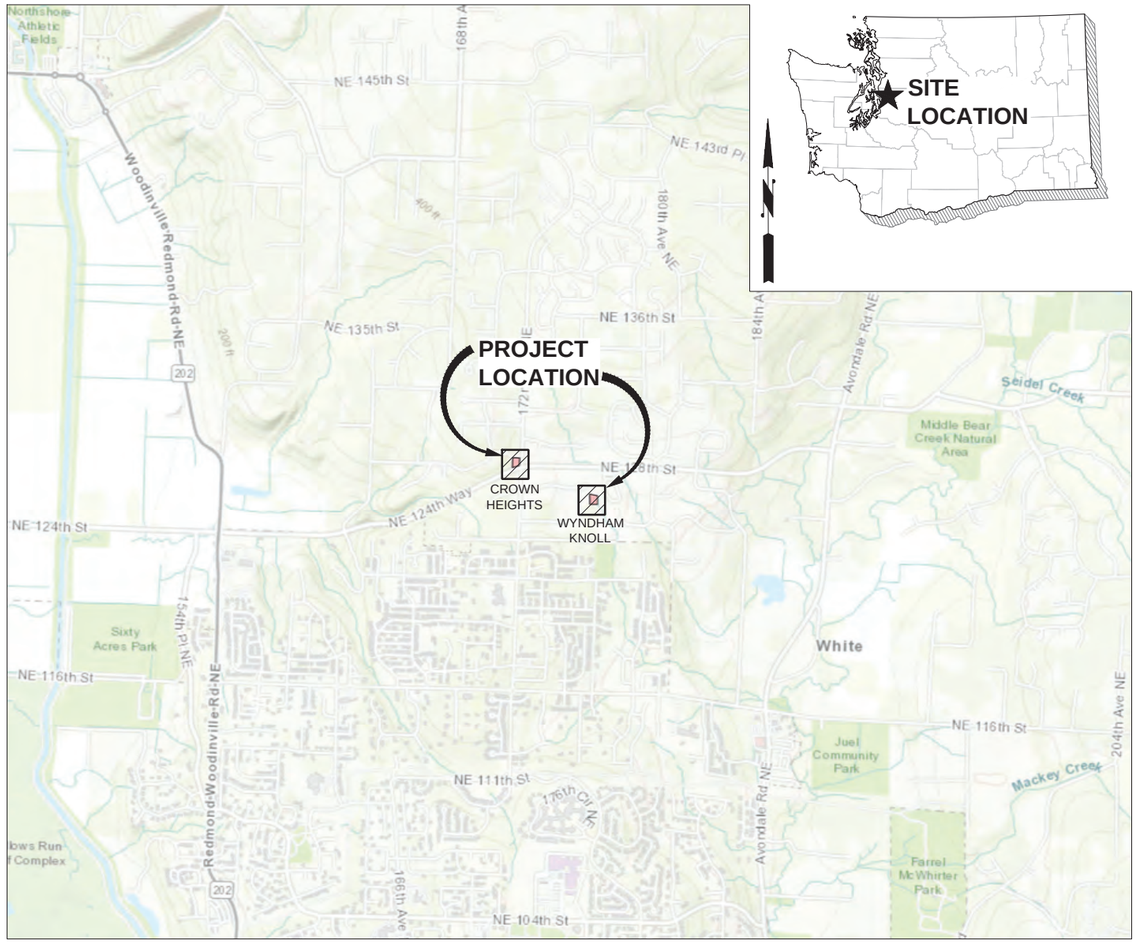
**Part 13 EROSION AND SEDIMENT CONTROL REQUIREMENTS**

| MINIMUM ESC REQUIREMENTS DURING CONSTRUCTION | MINIMUM ESC REQUIREMENTS AFTER CONSTRUCTION |
|---|---|
| ☐ Clearing Limits | ☒ Stabilize exposed surfaces |
| ☐ Cover Measures | ☐ Remove and restore Temporary ESC Facilities |
| ☒ Perimeter Protection | ☐ Clean and remove all silt and debris, ensure operation of Permanent Facilities, restore operation of Flow Control BMP Facilities as necessary |
| ☐ Traffic Area Stabilization | ☐ Flag limits of SAO and open space preservation areas |
| ☐ Sediment Retention | ☐ Other _____ |
| ☐ Surface Water Collection | |
| ☐ Dewatering Control | |
| ☐ Dust Control | |
| ☐ Flow Control | |
| ☐ Protection of Flow Control BMP Facilities (existing and proposed) | |
| ☒ Maintain BMPs / Manage Project | |

The Text Below replaces the text in the TIR

# CORE REQUIREMENT #5: EROSION AND SEDIMENT CONTROL

Up to approximately 380 square feet of land disturbance may be required for project completion at the Crown Heights location and up to approximately 320 square feet of land disturbance will be required for project completion at the Wyndham Knoll location. This maximum total of 700 square feet of land disturbance will be related to the installation of power conduit and small foundations for the solar power and control equipment.



This disturbance will occur within the pasture landcover adjacent to the ponds and based on the anticipated construction methods is expected to be stabilized with mulch and seed within 2 days of construction. The plans show providing Straw Wattles per BMP D.2.1.2.5 of the KCSWDM, Appendix D are shown for perimeter protection and seeding per BMP D.2.1.2.6 of the KCSWDM, Appendix D is shown for permeant stabilization.

A Construction Stormwater Pollution Prevention (CSWPP) plan will be included in the plan set for the proposed project and will provide temporary Erosion and Sediment Control (ESC) measures and the Stormwater Pollution Prevention and Spill Control (SWPPS) information. The

plan will be per the standards described in the King County *Construction Stormwater Pollution Prevention Standards* (KCSWDM Appendix D).

## REQUIRED SUBMITTALS:

1. SHOP DRAWINGS FOR THE TWO CORRUGATED ALUMINUM OUTLET RISERS (ONE PER PROJECT SITE).
2. STRUCTURAL CALCULATIONS FOR THE VALVE SUPPORT (DETAIL 3 ON SHEET C3.03).

## GENERAL NOTES:

1. ALL DESIGN AND CONSTRUCTION SHALL BE IN ACCORDANCE WITH PERMIT CONDITIONS, THE KING COUNTY CODE (KCC), ROAD STANDARDS (KCRS), WASHINGTON STATE DOT (WSDOT) STANDARD SPECIFICATIONS AND THE CONDITIONS OF PRELIMINARY APPROVAL. IT SHALL BE THE SOLE RESPONSIBILITY OF THE APPLICANT AND THE PROFESSIONAL CIVIL ENGINEER TO CORRECT ANY ERROR, OMISSION, OR VARIATION FROM THE ABOVE REQUIREMENTS FOUND IN THESE PLANS. ALL CORRECTIONS SHALL BE AT NO ADDITIONAL COST OR LIABILITY TO KING COUNTY.

2. THE DESIGN ELEMENTS WITHIN THESE PLANS HAVE BEEN REVIEWED ACCORDING TO THE KING COUNTY DEPARTMENT OF DEVELOPMENT AND ENVIRONMENTAL SERVICES (DDES) ENGINEERING REVIEW CHECKLIST. SOME ELEMENTS MAY HAVE BEEN OVERLOOKED OR MISSED BY THE DDES PLAN REVIEWER. ANY VARIANCE FROM ADOPTED STANDARDS IS NOT ALLOWED UNLESS SPECIFICALLY APPROVED BY KING COUNTY PRIOR TO CONSTRUCTION.

3. APPROVAL OF THIS ROAD, GRADING, PARKING AND DRAINAGE PLAN DOES NOT CONSTITUTE AN APPROVAL OF ANY OTHER CONSTRUCTION (E.G. DOMESTIC WATER CONVEYANCE, SEWER CONVEYANCE, GAS, ELECTRICAL, ETC.)

4. A COPY OF THESE APPROVED PLANS MUST BE ON THE JOB SITE WHENEVER CONSTRUCTION IS IN PROGRESS.

5. GRADING ACTIVITIES (SITE ALTERATION) ARE LIMITED TO THE HOURS OF 7 A.M. TO 7 P.M. MONDAY THROUGH SATURDAY AND 10 A.M. TO 5 P.M. ON SUNDAY, UNLESS OTHERWISE APPROVED WITH A WRITTEN DECISION BY THE REVIEWING AGENCY.

6. IT SHALL BE THE APPLICANT'S/CONTRACTOR'S RESPONSIBILITY TO OBTAIN ALL CONSTRUCTION EASEMENTS NECESSARY BEFORE INITIATING OFF-SITE WORK. EASEMENTS REQUIRE REVIEW AND APPROVAL PRIOR TO CONSTRUCTION.

7. DATUM SHALL BE KCAS UNLESS OTHERWISE APPROVED BY DDES.

8. ALL UTILITY TRENCHES AND ROADWAY SUBGRADE SHALL BE BACKFILLED AND COMPACTED TO 95 PERCENT DENSITY, STANDARD PROCTOR.

9. OPEN CUTTING OF EXISTING ROADWAYS FOR NON-FRANCHISED UTILITY OR STORM WORK IS NOT ALLOWED UNLESS SPECIFICALLY APPROVED BY DDES AND NOTED ON THESE APPROVED PLANS. ANY OPEN CUT SHALL BE RESTORED IN ACCORDANCE WITH KCRS.

10. THE CONTRACTOR SHALL BE RESPONSIBLE FOR PROVIDING ADEQUATE SAFEGUARDS, SAFETY DEVICES, PROTECTIVE EQUIPMENT, FLAGGERS, AND ANY OTHER NEEDED ACTIONS TO PROTECT THE LIFE, HEALTH, AND SAFETY OF THE PUBLIC, AND TO PROTECT PROPERTY IN CONNECTION WITH THE PERFORMANCE OF WORK COVERED BY THE CONTRACTOR. ANY WORK WITHIN THE TRAVELED RIGHT-OF-WAY THAT MAY INTERRUPT NORMAL TRAFFIC FLOW SHALL REQUIRE AT LEAST ONE FLAGGER FOR EACH LANE OF TRAFFIC AFFECTED. MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES (MUTCD) SHALL APPLY. WORK IN RIGHT-OF-WAY IS NOT AUTHORIZED UNTIL A TRAFFIC CONTROL PLAN IS APPROVED BY KING COUNTY.

## EROSION CONTROL NOTES:

1. NOT USED

2. ANY AREAS OF EXPOSED SOILS, INCLUDING ROADWAY EMBANKMENTS, THAT WILL NOT BE DISTURBED FOR TWO DAYS DURING THE WET SEASON OR SEVEN DAYS DURING THE DRY SEASON SHALL BE IMMEDIATELY STABILIZED WITH DOT MULTIPURPOSE GRASS SEED MIX AVAILABLE FROM SUNMARK SEEDS. APPLY SEED, MULCH, AND SLOW RELEASE FERTILIZER AS RECOMMENDED BY SUNMARK SEEDS.

3. PRIOR TO THE BEGINNING OF THE WET SEASON (OCT. 1), ALL DISTURBED AREAS SHALL BE REVIEWED TO IDENTIFY WHICH ONES CAN BE SEEDED IN PREPARATION FOR THE WINTER RAINS. DISTURBED AREAS SHALL BE SEEDED WITHIN ONE WEEK OF THE BEGINNING OF THE WET SEASON. A SKETCH MAP OF THOSE AREAS TO BE SEEDED AND THOSE AREAS TO REMAIN UNCOVERED SHALL BE SUBMITTED TO THE DDES INSPECTOR FOR REVIEW.

AUTHOR: CWebb
LAST EDITED: August 8, 2022
FILE: O:\nrs\Y2020\20-07412-017\CAD\Sheet\Drawings_Plan.dwg

## CROWN HEIGHTS POND CONTROL STRUCTURE

SCALE: 1" = 2'

1 C2.01

## WYNDHAM KNOLL POND CONTROL STRUCTURE

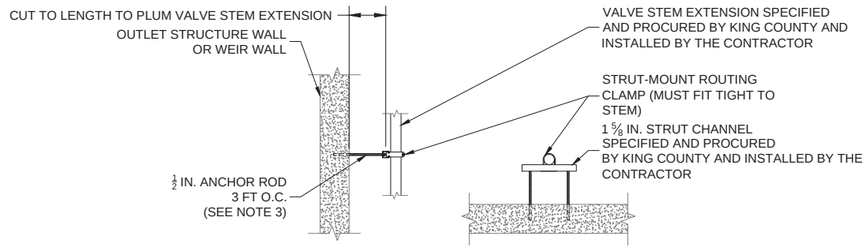
SCALE: 1" = 2'

2 C2.02

OPTI RTC CMAC INSTALLATION NOTES:

1. OPTI SPECIFIED EQUIPMENT (KING COUNTY WILL PROCURE AND PROVIDE TO CONTRACTOR):
   - 1.1. ACTUATOR, BUTTERFLY VALVE, AND VALVE STEM EXTENSION (DELIVERED PRE-ASSEMBLED ON PALLET)
   - 1.2. FLANGED PIPE SECTION AND RUBBER GASKET
   - 1.3. POLYWATER FOAM DUCT SEALANT (SENT WITH OPTI CONTROL PANEL)

   ALL OTHER EQUIPMENT TO BE PROCURED BY INSTALLATION CONTRACTOR.



2. GROUT/SEAL THE VALVE STEM PENETRATION WITH PREPACKAGED NON-SHRINK GROUT MEETING THE REQUIREMENTS OF ASTM C1107 (MIN. COMPRESSIVE STRENGTH 4,000 PSI AT 7 DAYS) OR SINGLE-COMPONENT POLYURETHANE SEALANT CONFORMING TO ASTM C920 TYPE S, GRADE NS, CLASS 25, USE M.

3. IP68 CORD GRIP REQUIRED FOR CONNECTION BETWEEN WIRE AND CONTROL PANEL. ALL CONDUIT CONNECTIONS TO BE IP68 RATED AND SEALED WITH POLYWATER FOAM DUCT SEALANT. CONDUIT TO BE SIZED BY CONTRACTOR. ACTUATOR CONDUIT PORT IS ¾ IN. INTERNAL THREADED, DOWNSIZE CONDUIT IF NEEDED. CONDUIT ALONG WALL TO BE SECURED WITH #304 SS CLIPS (3' SPACING MAXIMUM).

4. CONTRACTOR TO ENSURE FLANGE AND VALVE ARE COMPATIBLE. VALVE IS A PRATT BF SERIES WAFER/LUG BUTTERFLY VALVE. FLANGE BOLTS SHALL BE #304 STAINLESS STEEL AND BE TIGHTENED TO THE TORQUE SETTINGS RECOMMENDED BY THE VALVE MANUFACTURER (PRATT).

5. FLANGE TO WALL CONNECTION: BOLT CAVITIES TO BE CLEANED OF DEBRIS USING AUTO CLEANING DRILL BIT OR COMPRESSED AIR PRIOR TO ANCHORING. BOLT CAVITIES TO BE FILLED WITH INJECTABLE ADHESIVE ANCHOR (HILTI HIT SERIES EPOXY #2123401 OR EQUIVALENT). BOLTS TO BE EMBEDDED TO MINIMUM DEPTH SPECIFIED BY MANUFACTURER, 1 IN. CLEARANCE FROM REBAR.

6. PROVIDE AT LEAST ONE 3 X 0.090 GAUGE SUPPORT BRACKET ANCHORED TO CONCRETE WALL WITH 5/8 IN. STAINLESS STEEL EXPANSION BOLTS OR EMBEDDED SUPPORTS 2 IN. INTO M/H WALL (VERTICAL SPACING).

NOTES:

1. OPTI SPECIFIED EQUIPMENT (KING COUNTY WILL PROCURE AND PROVIDE TO CONTRACTOR):
   - 1.1. VALVE STEM EXTENSION (DELIVERED WITH VALVE)
   - 1.2. 12" x 1 5/8 IN. STRUT CHANNEL
   - 1.3. 18" x ½ IN. ANCHOR RODS (2 PER STRUT)
   - 1.4. STRUT-MOUNT ROUTING CLAMPS (2 PER STRUT)

2. ALL BRACKET MATERIALS MUST BE #304 STAINLESS STEEL.

3. MINIMUM SPACING: 1 VALVE STEM MOUNT FOR STEM LENGTH BELOW 3 FEET. ADD VALVE STEM MOUNTS PER ADDITIONAL 3 FEET OF STEM LENGTH.

4. ½ IN. ANCHOR ROD TO BE SET USING INJECTABLE ADHESIVE ANCHOR WITH AUTO CLEANING DRILL BIT OR CLEAN HOLE THOROUGHLY WITH COMPRESSED AIR. USE QUIKRETE HIGH STRENGTH ANCHORING EPOXY (PRODUCT #8620-31) OR EQUIVALENT. ROD SET IN CONCRETE MIN 3 IN..

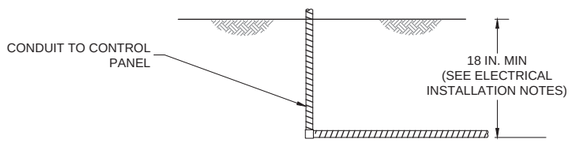
AUTHOR: CWitzel
LAST EDITED: August 8, 2022
FILE: O:\proj\V2020\20-07412-017\CAD\Sheet\Details.dwg

NOTES:



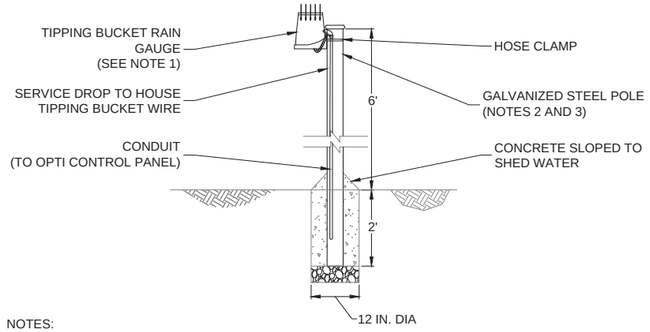
1. OPTI SPECIFIED EQUIPMENT (KING COUNTY WILL PROCURE AND PROVIDE TO CONTRACTOR):
   - 1.1. WATER LEVEL SENSOR
   - 1.2. POLYWATER FOAM DUCT SEALANT (SENT WITH OPTI CONTROL PANEL)

   ALL OTHER EQUIPMENT TO BE PROCURED BY INSTALLATION CONTRACTOR.
2. WATER LEVEL SENSOR TO REST WITHIN PVC STILLING WELL. SENSOR TO REST AT BOTTOM OF FACILITY OR AT SPECIFIED MINIMUM ELEVATION.
3. OPTI-SPECIFIED JUNCTION BOX REQUIRED IF CABLE LENGTH EXCEEDS 100 FT. JUNCTION BOX LOCATION TO BE SPECIFIED BY OPTI. BOTTOM OF JUNCTION BOX TO BE MOUNTED AT LEAST 4 IN. ABOVE OVERFLOW ELEVATION.
4. PENETRATIONS INTO ALL EQUIPMENT AND CONNECTIONS WITHIN JUNCTION BOXES SHALL BE IP68 RATED AND SEALED WITH POLYWATER FOAM DUCT SEALANT. SEE ELECTRICAL DIAGRAM FOR CABLE AND CONDUIT SPECIFICATION.
5. CONDUIT SECURED ON WALL WITH STAINLESS STEEL CLIPS (3' MAX SPACING). PVC STILLING WELL TO BE SECURED WITH STAINLESS STEEL PIPE STRAPPING (24 IN. MAX SPACING).
6. PRESSURE REFERENCE DEVICE TO BE LOCATED IN OPTI CONTROL PANEL. DO NOT SPLICE WATER LEVEL SENSOR CABLE.
7. MINIMUM 1 FOOT SPARE CABLING TO BE NEATLY COILED IN CONTROL PANEL FOR FUTURE MAINTENANCE OR SYSTEM MODIFICATIONS.

## WATER LEVEL SENSOR DETAIL (PRESSURE TRANSDUCER) WALL MOUNTED

SCALE: NTS

1 / C3.01



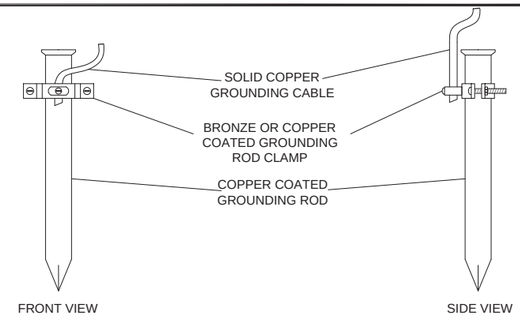
NOTES:

1. BURIED CONDUIT SHALL BE RIGID SCH 40 PVC
2. ALL CONDUIT PENETRATIONS ARE TO BE IP68 RATED.
3. REPLACED SOIL SHALL BE COMPACTED TO AT LEAST 95% OF ASTM D698.
4. AFTER BACKFILL STABILIZE SURFACE WITH DOT MULTIPURPOSE GRASS SEED MIX AVAILABLE FROM SUNMARK SEEDS. APPLY SEED, MULCH, AND SLOW RELEASE FERTILIZER AS RECOMMENDED BY SUNMARK SEEDS.

## CONDUIT BURIAL DETAIL

SCALE: NTS

5 / C2.01



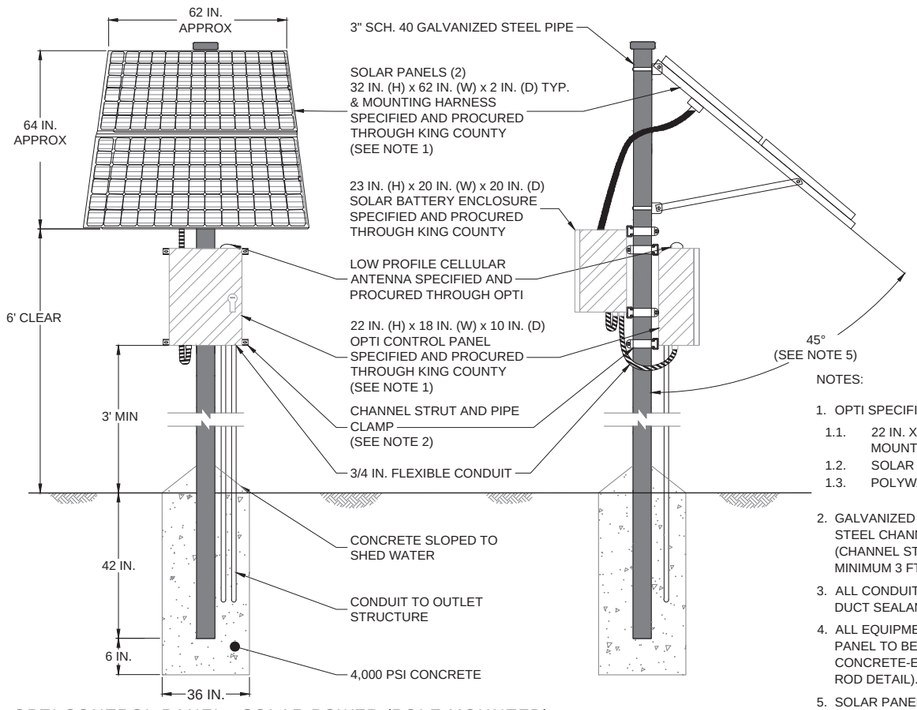
NOTES:

1. MOUNT TIPPING BUCKET RAIN GAUGE PER MANUFACTURERS INSTRUCTIONS.
2. TIPPING BUCKET MOUNT KIT COMES WITH U-BOLT TO FIT A 1.25 IN.-1.75 IN. POLE. CAN ALSO BE MOUNTED TO A 2.5 IN. POLE.
3. TIPPING BUCKET CAN BE MOUNTED ON ANY EXPOSED FREE STANDING POLE OR SURFACE ON SITE.
4. RAIN GAUGE SHOULD BE SITED SUCH THAT SURROUNDING OBJECTS ARE NO CLOSER THAN TWO TIMES THEIR HEIGHT ABOVE THE GAUGE.
5. ALL CONDUIT PENETRATIONS ARE TO BE IP68 RATED.

## RAIN GAUGE

SCALE: NTS

2 / C2.01



NOTES:

1. GROUNDING ROD TO BE MINIMUM COPPER COATED, 8 FT LENGTH, $\frac{3}{4}$ DIAMETER
2. GROUNDING ROD CLAMP TO BE BRONZE OR COPPER COATED AND SIZED FOR GROUNDING CABLE
3. GROUNDING CONDUCTOR TO BE SOLID COPPER, 12 AWG TO 2 AWG, AND SECURELY LANDED AT GROUNDING ROD CLAMP AND CONTROL PANEL GROUNDING LUG
4. ALL PENETRATIONS IN CONTROL PANEL TO BE 1P68 RATED
5. MAXIMUM 6 IN OF GROUNDING ROD EXPOSED ABOVE GROUND

## GROUNDING ROD DETAIL

SCALE: NTS

3 / C2.01

NOTES:

1. OPTI SPECIFIED EQUIPMENT (KING COUNTY WILL PROCURE AND PROVIDE TO CONTRACTOR):
   - 1.1. 22 IN. X 18 IN. X 10 IN. NEMA 4X CABINET WITH CELLULAR ANTENNA AND CHANNEL STRUT MOUNTING CLIPS
   - 1.2. SOLAR PANEL KIT AND MOUNTING HARNESS
   - 1.3. POLYWATER FOAM DUCT SEALANT (SENT WITH OPTI CONTROL PANEL)
2. GALVANIZED STEEL CHANNEL STRUT TO BE BOLTED TO SUPPORT POLE USING GALVANIZED STEEL CHANNEL STRUT PIPE CLAMPS. CONTROL PANEL TO BE BOLTED TO CHANNEL STRUT (CHANNEL STRUT MOUNTING CLIP SHIPPED WITH CONTROL PANEL). PANEL TO BE MOUNTED MINIMUM 3 FT. FROM GROUND.
3. ALL CONDUIT PENETRATIONS ARE TO BE IP68 RATED AND SEALED WITH POLYWATER FOAM DUCT SEALANT. SEE ELECTRICAL DIAGRAM FOR CABLE AND CONDUIT SPECIFICATION.
4. ALL EQUIPMENT TO BE GROUNDED TO CONTROL PANEL GROUNDING LUGS. OPTI CONTROL PANEL TO BE GROUNDED TO A GROUNDING ROD, GALVANIZED STEEL POLE, OR CONCRETE-ENCASED GROUNDING ELECTRODE. (SEE ELECTRICAL DIAGRAM AND GROUNDING ROD DETAIL).
5. SOLAR PANELS TO BE MOUNTED FACING SOUTH AT 45° FROM THE MOUNTING POLE.

## OPTI CONTROL PANEL - SOLAR POWER (POLE MOUNTED)

SCALE: NTS

SHEET 8 OF 10 SHEETS

C3.02

AUTHOR: CWebl
LAST EDITED: August 8, 2022
FILE: O:\proj\2020\20-07412-017\CAD\Sheet\Details.dwg

NOTES:

1. SHEAR GATE SHALL BE ALUMINUM ALLOY PER ASTM B-26-ZG-32a OR CAST IRON ASTM A48 CLASS 30B AS REQUIRED.
2. GATE SHALL BE 8 IN. DIAM. UNLESS OTHERWISE SPECIFIED.
3. GATE SHALL BE JOINED TO TEE SECTION BY BOLTING (THROUGH FLANGE), WELDING, OR OTHER SECURE MEANS.
4. LIFT ROD: AS SPECIFIED BY MFR. WITH HANDLE EXTENDING TO WITHIN ONE FOOT OF COVER AND ADJUSTABLE HOOK LOCK FASTENED TO FRAME OR UPPER HANDHOLD.
5. GATE SHALL NOT OPEN BEYOND THE CLEAR OPENING BY LIMITED HINGE MOVEMENT, STOP TAB, OR SOME OTHER DEVICE.
6. NEOPRENE RUBBER GASKET REQUIRED BETWEEN RISER MOUNTING FLANGE AND GATE FLANGE.
7. MATING SURFACES OF LID AND BODY TO BE MACHINED FOR PROPER FIT.
8. FLANGE MOUNTING BOLTS SHALL BE 3/8 IN. DIAM. STAINLESS STEEL.
9. ALTERNATE CLEANOUT/SHEAR GATES TO THE DESIGN SHOWN ARE ACCEPTABLE, PROVIDED THEY MEET THE MATERIAL SPECIFICATIONS ABOVE AND HAVE A SIX BOLT, 10 3/8 IN. BOLT CIRCLE FOR BOLTING TO THE FLANGE CONNECTION.
10. SEE THE WSDOT/APWA STANDARD SPECIFICATIONS SECTION 9-05.15 FOR METAL CASTINGS REQUIREMENTS.

## DETAIL - ELECTRICAL DIAGRAM (PROVIDED BY OPTI) 3 C2.01

SCALE: NTS

**ELECTRICAL INSTALLATION NOTES**

1. DETERMINE IF THERE ARE UNDERGROUND UTILITIES IN THE WORK AREA PRIOR TO EXCAVATION, BY CALLING DIG SAFE AT LEAST 48 HOURS PRIOR TO STARTING WORK. CONTRACTOR SHALL BE LIABLE FOR ANY DAMAGE TO UNDERGROUND UTILITIES CAUSED BY TRENCHING OR EXCAVATION.
2. INSTALLATION OF THE CONTROL PANEL AND ASSOCIATED COMPONENTS (E.G., CABLING, CONDUIT, SENSORS) MUST BE PERFORMED BY A LICENSED ELECTRICIAN. ELECTRICIAN SHALL BE RESPONSIBLE FOR ENSURING THAT THE CONTROL PANEL AND ASSOCIATED COMPONENTS ARE PROPERLY CONNECTED TO THE SOLAR POWER SYSTEM AND THAT CONDUIT AND CABLING IS SIZED AND INSTALLED PER THE NEC.
3. ALL CONDUCTORS SHALL BE IDENTIFIED AT EACH END (LABELED OR COLOR CODED) AND THE IDENTIFIED CONDUCTORS DOCUMENTED IN THE SITE LAYOUT MAP.
4. PENETRATIONS INTO CONTROL PANEL MUST BE IP68 RATED (NO WATER SHALL PENETRATE ANY SEALS). SUBSURFACE TERMINATIONS SHALL BE SEALED WITH POLYWATER CLOSED-CELL FOAM DUCT SEALANT (PROCURED THROUGH OPTI WITH CONTROL PANEL).
5. REFERENCE "ACTUATOR POWER CABLE AWG SPECIFICATIONS" TABLE FOR THE CORRECT CONDUCTOR GAUGE FOR ACTUATOR POWER CONNECTIONS. ALL OTHER CONDUCTORS MUST BE AT LEAST 16AWG.
6. ALL BURIED CONDUIT RUNS SHALL BE RIGID SCH 40 PVC CONDUIT. ALL EXPOSED CONDUIT SHALL BE RIGID SCH 40 PVC OR FLEXIBLE TYPE-UA PVC. BURIED RIGID SCHEDULE 40 CONDUIT SHALL BE INSTALLED WITH A MINIMUM COVER OF AT LEAST 18" IN ACCORDANCE WITH TABLE 300.5 OF THE NEC.
7. CONDUIT SHALL BE SIZED PER THE NEC TO HAVE AN ADEQUATE CROSS-SECTIONAL AREA FOR INSTALLED CABLES. REFERENCE OPTI PROVIDED TABLE FOR MINIMUM CONDUIT SIZE. ACTUATOR HAS ¾" PORTS FOR CONDUIT, USE REDUCING FITTING IF NEEDED.
8. LEAVE A MINIMUM OF 1 FOOT SPARE CABLING NEATLY COILED IN CONTROL PANEL FOR FUTURE MAINTENANCE OR SYSTEM MODIFICATIONS.
9. LEAVE A MINIMUM 3 FEET LOOP OF FLEXIBLE CONDUIT IN OUTLET STRUCTURE FOR EASE OF FUTURE MAINTENANCE. FLEXIBLE CONDUIT SHALL RUN FROM ACTUATOR TO JUNCTION BOX LOCATED IN OUTLET STRUCTURE. RIGID CONDUIT SHALL RUN FROM JUNCTION BOX TO OPTI CONTROL PANEL.
10. ALL SUBMERGED/SATURATED METAL HARDWARE SHALL BE STAINLESS STEEL. GALVANIZED STEEL MAY BE USED ABOVEGROUND OR IN DRY LOCATIONS.
11. PRESSURE REFERENCE DEVICE (COMPONENT OF LEVEL SENSOR AT CABLE TERMINATION) TO BE LOCATED IN OPTI CONTROL PANEL. USE LABELING SCHEME DICTATED ON ELECTRICAL SCHEDULE.
12. CONNECT ALL EQUIPMENT GROUNDING CONDUCTORS TO THE OPTI CONTROL PANEL GROUNDING LUGS. GROUND THE OPTI CONTROL PANEL TO A GROUNDING ROD, GALVANIZED STEEL POLE, OR A CONCRETE-ENCASED GROUNDING ELECTRODE.
13. AFTER INSTALLATION, COMPLETE CONTRACTOR INSTALLATION CHECKLIST PROVIDED BY OPTI AND PROVIDE PHOTOS OF ALL INSTALLED EQUIPMENT. SEND SIGNED CHECKLIST AND PHOTOS TO OPTI.
14. OPTI WILL INSPECT INSTALLED COMPONENTS PRIOR TO ENERGIZING THE SYSTEM. FINAL COMPLETION SHALL BE REACHED WHEN: (1) CONSTRUCTION OF THE SYSTEM PER THE PLANS IS COMPLETE; (2) THE ENGINEER OF RECORD HAS COMPLETED FINAL INSPECTION OF WORK AND ALL NOTED DEFICIENCIES HAVE BEEN CORRECTED TO THE SATISFACTION OF THE ENGINEER OF RECORD, OPTI, AND THE SITE OWNER; AND (3) AN AS-BUILT SKETCH HAS BEEN PROVIDED OF ALL INSTALLED COMPONENTS IF FINAL INSTALL LOCATIONS HAVE VARIED FROM PLANSET.
15. CONTRACTOR SHALL PROVIDE JUNCTION BOX 12" ABOVE GRADE WITHIN 15' OF THE CONTROL STRUCTURE.

# TECHNICAL MEMORANDUM

January 11, 2024

TO: Dylan Ahearn, Principal Scientist, Herrera

FM: Kyle Bliss, Science and Technical Support Section, Water and Land Resources Division, Department of Natural Resources and Parks

RE: RPWS Hydrologic Data QA Memo

## Introduction

This memo summarizes the results of the quality assurance review of hydrologic data collected by King County Department of Natural Resources (KCDNRP), Water and Land Resources Division (WLRD), Hydrologic Monitoring Program for the Redmond Paired Watershed Study (RPWS). The period of record covered under this memo begins at the 2023 water year (10/1/2022) and ends at end of the 2023 calendar year (12/31/2023).

Stream stage/discharge and water temperature were recorded at 12 sites for the study. Precipitation, air temperature, and barometric pressure were recorded at three sites. Instruments used to collect these parameters are listed in Table 1. See Figure 1 in Appendix A for station locations.

**Table 1**. Instruments used to measure continuous rainfall, water level (pressure), and water temperature for the RPWS from October 1, 2022 to December 31, 2023.

# Quality Assurance Review of Data

## Water Temperature

Continuous water temperature was generally measured with a Campbell Scientific 109UL temperature probe. Alternative instruments were used in situations where the primary 109UL malfunctioned, was buried, or went dry. Field observations of water temperature were made with a YSI Pro 30 handheld water quality instrument. If consistent differences were observed, shifts in the continuous temperature record were made to better match YSI observations. Table 2 summarizes information about water temperature data quality and data gaps.

**Table 2**. Notes on water temperature records for the RPWS from October 1, 2022 to December 31, 2023.

| Site Code | Data Rated | Gaps* | Notes* |
|---|---|---|---|
| COLM | Good | 10/1/2022 - 10/25/2022 and 7/26/2023 - 9/25/2023 | Channel Dry |
| COUMI | Good | None | |
| COUMO | Good | None | |
| MONMN | Good | None | |
| MONMO | Good | None | |
| MONMS | Fair | 4/6/2023 - 4/10/2023 | Sensor failure |
| SEIMN | Good | None | |
| SEIMS | Good | None | |

| TOSMO | Good | None | |
| TYLMI | Good | None | |
| TYLMO | Good | None | |
| * All times listed are in Pacific Daylight Savings Time (GMT - 07:00) | | | |

## *Precipitation*

Precipitation was measured using Hydrological Services TB6 tipping bucket rain gages. Rain gages were visited throughout the year (generally four times per year, seasonally) to ensure that they were free of debris and functionally correctly and their calibration checked (at least once per year). At the end of the calendar year, 5-minute rainfall data was compared to adjacent rain gages in the King County network to assess variability in the timing and magnitude of precipitation.

Precipitation falling as snow or hail was recorded at the time of melting (as opposed to at the time of falling) as the cones of the tipping bucket rain gages in this study were unheated.

See Table 3 below for comment on data quality and gaps in specific precipitation data. See Figure B in Appendix A for comparison to adjacent rain gages.

**Table 3**. Precipitation data recorded for the RPWS from October 1, 2022 to December 31, 2023.

| Site | Data Quality | Missing Data |
|---|---|---|
| RG_02vn (Trilogy) | Good record | No gaps |
| RG_EVA | Good record | No gaps |
| RG_MON | Good record | No gaps |
| RG_TOS | Fair record | -Gap from 10/22/2022 to 11/9/2022 due to datalogger failure: Data filled from RG_MARY<br>-Gage clogged from 11/2/2023 to 12/5/2023: Data filled from RG_MARY |

## *Discharge*

Continuous stream discharge was calculated for each stream gage using a multi-step process. First, water level (stage) at the stream gage was measured continuously using a Campbell Scientific CS451 vented pressure transducer. This continuous stage record was then converted to volumetric stream discharge using a rating curve developed through a series of simultaneous measurements of stage and discharge. Discharge measurements in the field were taken using the velocity-area method (Herschy 1993), with a HACH FH950 velocity meter.

After ratings were established, small shifts were applied to the rating to account for small changes to the stage/discharge relationship. In the event of a dramatic change to the stage/discharge relationship, new ratings were developed through additional field measurements.

### QA Review Methods

While all 12 project discharge gages were updated via telemetry, ultimately the final continuous hydrologic data was input into the King County Hydrologic database with a supervised process using a desktop computer application. The technician worked from a plot (printed chart created in a spreadsheet) of the continuous values for a set period, usually four to eight weeks and bracketed by field observations. For discharge data, the water level corrections, rating table and

shifts used were noted on the plot, along with explanatory notes. The plot was stored in the project file for the gage along with field notes and other materials. Rating curve development and gage problem solving occurred in a collegial environment with the team staff. Recorded data and field measurements were reviewed throughout the year to identify problems and target necessary measurements.

Annual review of the water year was performed after the final supervised workup. Data are typically reviewed by a different team member than who performed the initial workup, but due to time and staffing constraints, review of discharge data was performed by the field technician. A spreadsheet template was used with daily mean, max and min values, rainfall, comparison gages, field observations, and a QC checklist to structure the review. The review process is described in the STREAM GAGE DATA WORKUP QA/QC section in Appendix B.

**RPWS 10/1/2022 to 12/31/2023**

Rainfall totals were below average at the NOVH rain gage (by water year, data from 2000-2024) in the Redmond, WA area due to a relatively dry spring and summer, although there was some catch up at the end to the water year (see Figure 1).

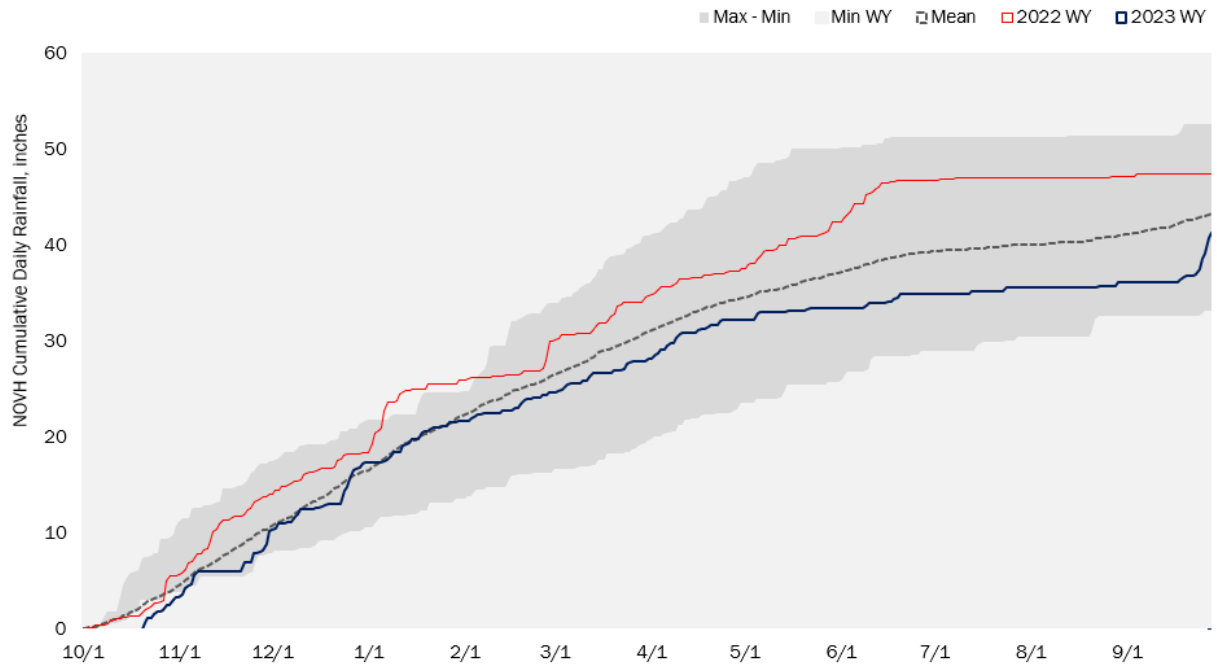

**Figure 1**. Cumulative rainfall at NOVH rain gage (in Redmond, WA) by water year (10/1 to 9/30). Includes data from 2000 to 2024. 2022 and 2023 water years are shown in red and blue, respectively. Average cumulative rainfall is shown in a gray dashed line. The range between the wettest and driest water years is shaded in dark gray.

The ten largest rainfall events over a 24-hour period between 10/1/2022 and 12/31/2023 are presented in Table 4 below. The largest event totaled 2.99" on 12/5/2023 which is 0.3" below the approximate 25- year 24-hour precipitation total for the Redmond area (King County 2021).

**Table 4**. The ten largest 24-hour rainfall totals recorded at the Monticello rain gage (RG_MON) from October 1, 2022, to December 31, 2023.

| Ending Date | 24-hr. total (in) |
|---|---|
| 05-Dec-23 | 2.99 |
| 28-Sep-23 | 2.06 |
| 24-Dec-22 | 1.71 |
| 25-Sep-23 | 1.55 |
| 27-Dec-22 | 1.17 |
| 04-Nov-23 | 1.06 |
| 02-Nov-23 | 1.03 |
| 23-Nov-22 | 1.02 |
| 04-Nov-22 | 0.96 |
| 26-Dec-22 | 0.96 |

## Missing Data

Missing 5-minute discharge data may be the result of technical issues with the gage (e.g., power failure, sensor failure) or dramatic changes to the stage/discharge relationship that cannot be accounted for with an adjustment to the discharge rating curve. In the case of technical issues, 15-minute data from non-vented U20 pressure transducers were used to fill gaps where possible. See Table 5 below for a summary of missing discharge data by station.

**Table 5**. Periods of missing discharge data for the RPWS from October 1, 2022, to December 31, 2023.

| Site | Notes* |
|---|---|
| COLM | ▪Periods of no flow 10/1/2022 - 10/25/2022 and 7/26/2023 - 9/25/2023 |
| COUMO | None |
| MONMN | None |
| MONMO | None |
| MONMS | ▪Gap 4/6/2023 - 4/10/2023 due to sensor malfunction |
| SEIMN | None |
| SEIMS | None |
| TOSMI | None |
| TOSMO | None |
| TYLMI | None |
| TYLMO | None |

* All times listed are in Pacific Daylight Savings Time (GMT – 07:00)

**Uncertain Data**

Given the indirect nature of discharge data development, there are many sources of uncertainty in this process, including:

- inaccuracy of field measurements of stage and discharge
- inaccuracy of continuous stage measurements
- a rating table that poorly represents the stage/discharge relationship at the full range of stream discharge that a given stream conveys in a given time period
- changes to the stage/discharge relationship, including:
    - scour and/or fill of the stream bed during storm events
    - vegetation growth on banks or in channel
    - debris accumulating in the section of the stream channel that controls water level at the stream gage

The most common cause of uncertain flow data was instability of section controls (i.e., objects in a stream channel that control the water level at the stream gage) for stations with non-engineered hydraulics. These stations include COUMI, EVAMS, MONMN, and TYLMI. See Table 6 for a summary of data uncertainties.

**Table 6**. Summary of data with notable uncertainty for the RPWS from October 1, 2022, to December 31, 2023.

| Site | Notes* |
|---|---|
| COLM | ▪None |
| COUMI | ▪None |
| COUMO | ▪ Some uncertainty around events due to control instability. |
| MONMN | ▪Some uncertainty around largest storm flows. |
| MONMO | ▪Peak flows seem relatively low. |
| MONMS | ▪Control stable but manual measurements difficult due to vegetation. |
| SEIMN | ▪Drop in record 11/13/2022 left in as not attributable to staff visit. Discharge values leading up to that may be high. |
| SEIMS | ▪None |
| TOSMI | ▪ Control eroded in 12/5/23 event, confirmed shift with manual measurement afterward. Will need adjust rating. |
| TOSMO | ▪None |
| TYLMI | ▪ Section control is very wide creating poor resolution in low end of ratings. Poor relationship between baseflows at TYLMI and TYLMO noted in past improving but will continue to monitor. |
| TYLMO | ▪Discharge totals suspect, likely due to control aggradation and/or stilling well infill. Site maintenance planned for 2024. |

* All times listed are in Pacific Daylight Savings Time (GMT – 07:00)

**Data Rating**

Continuous discharge data from each station was given a rating, from poor to good, for the period beginning on October 1, 2022, and ending on December 31, 2023. See Table 7 for a summary of data quality ratings. Good data had a complete record through the period, a good number (8 – 10) of field observations at both low and high discharge conditions, and a consistent stage/discharge relationship due to a very stable or engineered control. Poor data were usually characterized a very unstable control that caused numerous rating shifts to accommodate. Extended periods where debris such as leaves, algae, or wood accumulated on controls also negatively affected the data rating as did the lack of a recent high flow or summer low flow measurement (see Table C in Appendix A for a table comparing measured vs. calculated discharge values for each station).

**Table 7.** Summary of discharge data quality rating from October 1, 2022, to December 31, 2023.

| Site | Notes |
|---|---|
| COLM | **Fair to good record**. Channel relatively stable. Mostly small rating shifts to match flow measurements. |
| COUMI | **Fair to good record** New rating created after scour event last water year. |
| COUMO | **Fair record**. Moderate rating shifts to account for changes to section control. Some scour/fill apparent. |
| MONMN | **Fair record.** Good coverage of rating with flow measurements but some channel instability, especially around large storm flows. |
| MONMO | **Good record.** Engineered control is stable and clear of debris. |
| MONMS | **Good record.** Engineered control with little debris. |
| SEIMN | **Fair Record**. Gravel frequently builds up on weir - Rating good when weir ramp clear of gravel however moderate (but consistent) shifts needed to correct when buildup occurs. |
| SEIMS | **Good Record.** Engineered control is stable, very little debris buildup. Some question of rating at higher flows near or above control. |
| TOSMI | **Fair to good record**. Rating will need to be adjusted in 2024 due to scour event 12/5/2023. Relationship between TOSMI and TOSMO still appears questionable at times. Reach at least appears to be losing water in certain conditions. |
| TOSMO | **Good record.** Stable, engineered control. Minimal debris in weir. |
| TYLMI | **Record fair to good**. Section control unstable and prone to debris. |
| TYLMO | **Fair record.** Good coverage with flow measurements however site maintenance needed in 2024. |

* time period where flow measurements were taken to develop ratings used to develop data from 10/1/2022 to 12/31/2023
**length of time from start of RPWS project to most recent measurements

**Table C**. Table of maximum discharge measurements (for differing time periods) and maximum calculated discharge record. Maximum calculated discharge record in session values is highlighted in yellow if they are more than two times the maximum volume measured in the field during the time period used to develop the current stage/discharge ratings and highlighted in red if the values is double the volume ever measured in the field during the entirety of the RPWS project. Note that SEIMN and SEIMS both have engineered controls and older high flow measurements are still valuable.

# APPENDIX B: STREAM GAGE DATA WORKUP QA/QC DESCRIPTION

A streamflow data workup should be checked by another technician before approving the data for publication. This is not a rote process or simple checklist. It requires an understanding of the basic elements of a data workup as well as a questioning attitude. The check can go quickly if the person doing the original workup has taken good notes, kept the file in good order, made the necessary graphs and reports, and did not make any mistakes. The QA/QC check should be performed by someone other than the person who did the original workup. This ensures that we get a realistic assessment of the coherence and legibility of the workup and documentation. We want to be able to return to the file at a later date and figure out how the flow data were derived from the primary data. We also want to make sure that the data make sense and contain no errors. Of course we will never know if our flow data are accurate, but we can know that they are the best numbers possible if rating tables are well developed and the rating properly applied to a carefully corrected stage record. The following steps are outlined in the order they should occur.

## Three Objectives

1. Well documented work, so in the future we can figure out what was done and why. If the file and notes are a mess and don't make sense, you give it back and tell them to get it together.
2. Careful work, i.e., no stupid or gross mistakes. No gaps, no big jumps in discharge when there shouldn't be, flow in data table matches the discharge measurement made at that time, sensor garbage is cleaned up. Stupid mistake example: the flow record changes 15% in one log between sessions because the initial sensor correction was set incorrectly.
3. Technically defensible work, no errors in judgment. Rating curves make sense, stage corrections are reasonable, rating shifts applied appropriately, estimated periods make sense.

## QA/QC steps to checking flow records

### Documentation

There may be some minor problems with the file organization that did not affect the workup quality. These the checker can fix. Make sure that:

- The paper file is organized correctly
- There is a workup cover sheet with session-by-session notes
- Workup charts are all there and gaps noted, workup detail is written on the chart
- Discharge Measurement Summary form is up to date
- Flows are correctly plotted on rating curve
- Data input files are stored correctly
- Water year QA spreadsheet is complete (use StreamGage_WaterYear_Report.xlsx template). Charts titles should be correct, rain gage and comparison gage data included, also any continuous water temperature or other water quality data if applicable.

## Look for mistakes

- Is water year complete? Complete 15-minute years have 35,040 records, leap years 35,136 (5 minute have 105,120). Missing data will reduce that number. The logs for the year are displayed on the workup screen. Also, missing data will be held with asterisks in the 15-minute report. Dump the report into excel and sort by value.
- Compare the graph of the daily mean and max flow to that of an equivalent gage. You're looking at the timing and relative magnitude of peaks and low flow periods.
- Examine daily mean and min flows chart. You're looking for periods where the flow drops unrealistically, usually due to sensor problems, a negative value, or a mistaken filled value.
- Check the data table at date and time of discharge measurements. The record should match the flow or there should be a good reason why in the notes.
- Check the plotting of each flow measurement on the rating curve. Sometimes the offset is incorrectly added or it's just put in the wrong place. It can look right and be wrong, so check.
- Give flow measurements a once over to make sure they are sensible, V*A = Q, the calculated width seems right given the start and end of the cross section. Pay special attention to high flow measurements or any flow that shifts off the normal rating.
- Does the flow record connect well? No unjustified jumps in the discharge between sessions, stage corrections or other events.
- Are estimate periods flagged correctly.

## Technical quality

- Can you understand what rating curves were used, and what they are based on? What defines the high end?
- If the high end depends on a curve extension, are there indirect discharge calculations made to justify the peak flow estimate? Do you agree? This is a highly subjective area that bears careful examination. We expect, of course, that consultation was done during the initial workup, so there will be no big surprises.
- Are base flows accurate? It may be more accurate to estimate low flow periods or fill the stage record than use stage record with known error.
- Check how daily flow estimates to fill gaps were made.
- Compare mean daily discharge with an appropriate nearby station for timing and magnitude of peaks, baseflow etc.

## Final approval

If everything is in order, or after corrections have been made, complete QC checklist sheet in the Water Year spreadsheet. Printout checklist for the paper file. Include name and date.

# Appendix D

## Summary Statistics for Individual Storm Events by Monitoring Station

HERRERA

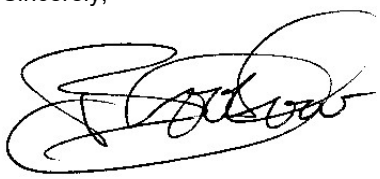
Re: Analytical Data for Project 14-05806-000
Laboratory Reference No. 2209-267



Dear Jess:

Enclosed are the analytical results and associated quality control data for samples submitted on September 27, 2022.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

Blair Goodrow
Project Manager

Enclosures

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: October 13, 2022
Samples Submitted: September 27, 2022
Laboratory Reference: 2209-267
Project: 14-05806-000

**Case Narrative**

Samples were collected on September 27, 2022 and received by the laboratory on September 27, 2022. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Total Suspended Solids SM 2540D Analysis

All samples except MONM-2022 (09-267-08) and QC-123-20220927 (09-267-14) were reanalyzed out of holding time because of low spike blank recovery. Samples MONM-2022 (09-267-08) and QC-123-20220927 (09-267-14) could not be reanalyzed because of insufficient sample. They are reported from the initial analysis. The samples that were reanalyzed, have a higher PQL do to limited amount of sample.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

and is intended only for the use of the individual or company to whom it is addressed.

OnSite Environmental Inc.

**Data Qualifiers and Abbreviations**

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-napthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

N1 - Hydrocarbons in diesel range are impacting lube oil range results.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical _____.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

X1- Sample extract treated with a Sulfuric acid/Silica gel cleanup procedure.

Y - The calibration verification for this analyte exceeded the 20% drift specified in method 8260C, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.

Z -

ND - Not Detected at PQL
PQL - Practical Quantitation Limit
RPD - Relative Percent Difference

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

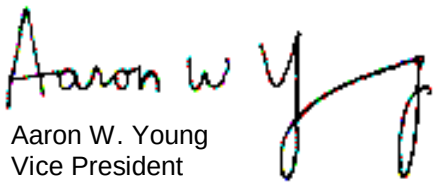
| QA123-20220927 | Water | 22-A016440 | Micro, NUT |

Your samples were received on Wednesday, September 28, 2022. At the time of receipt, the samples were logged in and properly maintained prior to the subsequent analysis.



The analytical procedures used at AmTest are well documented and are typically derived from the protocols of the EPA, USDA, FDA or the Army Corps of Engineers.

Following the analytical data you will find the Quality Control (QC) results.

Please note that the detection limits that are listed in the body of the report refer to the Practical Quantitation Limits (PQL's), as opposed to the Method Detection Limits (MDL's).

If you should have any questions pertaining to the data package, please feel free to contact me.

Sincerely,

Aaron W. Young
Vice President

**QC Summary for sample numbers: 22-A016427 to 22-A016440**

## DUPLICATES

| SAMPLE # | ANALYTE | UNITS | SAMPLE VALUE | DUP VALUE | RPD |
|---|---|---|---|---|---|
| 22-A016427 | Fecal Coliform | CFU/100 ml | 870 | 880 | 1.1 |
| 22-A016440 | Fecal Coliform | CFU/100 ml | < 1 | < 1 | |
| 22-A016326 | Total Nitrogen (TKN) | mg/l | 2.33 | 2.34 | 0.43 |
| 22-A016440 | Total Nitrogen (TKN) | mg/l | 0.348 | 0.350 | 0.57 |
| 22-A016630 | Total Nitrogen (TKN) | mg/l | < 0.25 | < 0.25 | |
| 22-A016635 | Total Nitrogen (TKN) | mg/l | < 0.25 | < 0.25 | |
| 22-A016393 | Total Nitrate + Nitrite | mg/l | < 0.02 | < 0.02 | |
| 22-A016428 | Total Nitrate + Nitrite | mg/l | 0.234 | 0.233 | 0.43 |
| 22-A016439 | Total Nitrate + Nitrite | mg/l | 0.642 | 0.634 | 1.3 |
| 22-A016440 | Total Nitrate + Nitrite | mg/l | < 0.02 | < 0.02 | |
| 22-A016633 | Total Nitrate + Nitrite | mg/l | 0.309 | 0.306 | 0.98 |
| 22-A016734 | Total Nitrate + Nitrite | mg/l | 0.153 | 0.161 | 5.1 |
| 22-A016746 | Total Nitrate + Nitrite | mg/l | 0.108 | 0.104 | 3.8 |
| 22-A016755 | Total Nitrate + Nitrite | mg/l | < 0.02 | < 0.05 | |

## MATRIX SPIKES

| SAMPLE # | ANALYTE | UNITS | SAMPLE VALUE | SMPL+ SPK | SPK AMT | RECOVERY |
|---|---|---|---|---|---|---|
| 22-A016326 | Total Nitrogen (TKN) | mg/l | 2.33 | 4.29 | 2.00 | 98.00 % |
| 22-A016440 | Total Nitrogen (TKN) | mg/l | 0.348 | 2.36 | 2.00 | 100.60 % |
| 22-A016630 | Total Nitrogen (TKN) | mg/l | < 0.25 | 2.26 | 2.00 | 113.00 % |
| 22-A016635 | Total Nitrogen (TKN) | mg/l | < 0.25 | 2.28 | 2.00 | 114.00 % |
| 22-A016393 | Total Nitrate + Nitrite | mg/l | < 0.02 | 0.963 | 1.00 | 96.30 % |
| 22-A016428 | Total Nitrate + Nitrite | mg/l | 0.234 | 1.13 | 1.00 | 89.60 % |
| 22-A016439 | Total Nitrate + Nitrite | mg/l | 0.642 | 1.74 | 1.00 | 109.80 % |
| 22-A016440 | Total Nitrate + Nitrite | mg/l | < 0.02 | 1.05 | 1.00 | 105.00 % |
| 22-A016633 | Total Nitrate + Nitrite | mg/l | 0.309 | 1.32 | 1.00 | 101.10 % |
| 22-A016734 | Total Nitrate + Nitrite | mg/l | 0.153 | 1.17 | 1.00 | 101.70 % |
| 22-A016746 | Total Nitrate + Nitrite | mg/l | 0.108 | 1.08 | 1.00 | 97.20 % |
| 22-A016755 | Total Nitrate + Nitrite | mg/l | < 0.02 | 0.917 | 1.00 | 91.70 % |

## STANDARD REFERENCE MATERIALS

| ANALYTE | UNITS | TRUE VALUE | MEASURED VALUE | RECOVERY |
|---|---|---|---|---|
| Total Nitrogen (TKN) | mg/l | 1.00 | 1.00 | 100. % |
| Total Nitrogen (TKN) | mg/l | 1.00 | 0.985 | 98.5 % |
| Total Nitrate + Nitrite | mg/l | 1.00 | 0.941 | 94.1 % |
| Total Nitrate + Nitrite | mg/l | 1.00 | 0.953 | 95.3 % |
| Total Nitrate + Nitrite | mg/l | 1.00 | 0.924 | 92.4 % |

# Sample/Cooler Receipt and Acceptance Checklist

Client: HEC

Client Project Name/Number: 14-05806-000

OnSite Project Number: 09-267

Initiated by: MV

Date Initiated: 9/27/22

## 1.0 Cooler Verification

| | | | | | |
|---|---|---|---|---|---|
| 1.1 Were there custody seals on the outside of the cooler? | Yes | (No) | N/A | 1 2 3 4 | |
| 1.2 Were the custody seals intact? | Yes | No | (N/A) | 1 2 3 4 | |
| 1.3 Were the custody seals signed and dated by last custodian? | Yes | No | (N/A) | 1 2 3 4 | |
| 1.4 Were the samples delivered on ice or blue ice? | (Yes) | No | N/A | 1 2 3 4 | |
| 1.5 Were samples received between 0-6 degrees Celsius? | (Yes) | No | N/A | Temperature: | 6.5.6 |
| 1.6 Have shipping bills (if any) been attached to the back of this form? | Yes | (N/A) | | | |
| 1.7 How were the samples delivered? | (Client) | Courier | UPS/FedEx | OSE Pickup | Other |

## 2.0 Chain of Custody Verification

| | | | | |
|---|---|---|---|---|
| 2.1 Was a Chain of Custody submitted with the samples? | (Yes) | No | | 1 2 3 4 |
| 2.2 Was the COC legible and written in permanent ink? | (Yes) | No | | 1 2 3 4 |
| 2.3 Have samples been relinquished and accepted by each custodian? | (Yes) | No | | 1 2 3 4 |
| 2.4 Did the sample labels (ID, date, time, preservative) agree with COC? | Yes | (No) | | 1 2 3 4 |
| 2.5 Were all of the samples listed on the COC submitted? | Yes | (No) | | 1 2 3 4 |
| 2.6 Were any of the samples submitted omitted from the COC? | Yes | (No) | | 1 2 3 4 |

## 3.0 Sample Verification

| | | | | |
|---|---|---|---|---|
| 3.1 Were any sample containers broken or compromised? | (Yes) | No | | 1 2 3 4 |
| 3.2 Were any sample labels missing or illegible? | (Yes) | No | | 1 2 3 4 |
| 3.3 Have the correct containers been used for each analysis requested? | (Yes) | No | | 1 2 3 4 |
| 3.4 Have the samples been correctly preserved? | (Yes) | No | N/A | 1 2 3 4 |
| 3.5 Are volatiles samples free from headspace and bubbles greater than 6mm? | Yes | No | (N/A) | 1 2 3 4 |
| 3.6 Is there sufficient sample submitted to perform requested analyses? | (Yes) | No | | 1 2 3 4 |
| 3.7 Have any holding times already expired or will expire in 24 hours? | (Yes) | No | | 1 2 3 4 |
| 3.8 Was method 5035A used? | Yes | No | (N/A) | 1 2 3 4 |
| 3.9 If 5035A was used, which sampling option was used (#1, 2, or 3). | # | | (N/A) | 1 2 3 4 |

**Explain any discrepancies:**

2.4) #5) no -0927 on DOC poly #9) no-0927 on labels
#10) no -0927 on Total P & Total Metals poly #14,15) no-0927 on labels
2.5) #11) COLM-20220927 not submitted
3.1) #6) Total P poly empty
3.2) #8) TSS poly ID illegible #12) Total metal, Total P ID illegible
3.7) Coliform will expire in 24hrs

1 - Discuss issue in Case Narrative
2 - Process Sample As-is
3 - Client contacted to discuss problem
4 - Sample cannot be analyzed or client does not wish to proceed

# METER CALIBRATION LOG - Redmond Paired Watershed Study

| | |
|---|---|
| Project Number: | 14-05806-000 |
| Personnel Performing Calibration: | D. Garcia |
| Meter: | Pro DSS #1 |
| Date/Time: | 9/27/22 10:45 |
| Barometric Pressure Start of Day: | mmHg: 761.7 Time: 10:45 |
| Barometric Pressure End of Day: | mmHg: 764.4 Time: 16:30 |

| PRE Field Run CALIBRATION | Meter Reading | Buffer / Cal Std | Temp °C | Comments |
|---|---|---|---|---|
| Conductivity (µS/cm) | 7.6 | 0 | 22.9 | |
| Conductivity (µS/cm) | 1004 | 1,000 | 22.6 | |
| Conductivity (µS/cm) | 102.4 | 100 | 22.1 | |
| DO % Saturation | 99.8 | 100 | 22.2 | |

| POST Field Run CHECK | Meter Reading | Buffer / Cal Std | Temp °C | Comments |
|---|---|---|---|---|
| Conductivity (µS/cm) | 0.7 | 0 | 22.8 | |
| Conductivity (µS/cm) | 100.1 | 100 | 22.6 | |
| DO % Saturation | 101 | 100 | 22.4 | |

**Calibration Procedures:**

**Rinse Multimeter Sonde Between Each Operation**

Rinse 3 times with tap water, 3 times with deionized water, then 3 times with the solution to be used for calibrating or testing.

**Conductivity Calibration Notes:**

1. Dry the conductivity probe with a lab tissue (e.g., KimWipes®) and DI water.
2. Fill calibration cup to within a centimeter of the top of the calibration cup with DI water (0 µS).
3. Fill the calibration cup with 1,000 µS standard so that the temperature/conductivity probe is submerged.
4. Make sure there are no bubbles in the cell; wait 2 minutes.
5. Enter the appropriate standard value (1,000 µS/cm or 1.0 mS/cm) for Sp Cond.
6. Check conductivity using 100 µS/cm standard.

**Dissolved Oxygen Calibration Notes:**

1. Fill the calibration cup with about 1/2 inch of DI; it should be below the sensor cap.
2. Use KimWipes® to dry any droplets from the sensor cap.
3. Invert calibration cup's cap and gently rest it on the cup.
4. Wait 5 minutes, making sure that temperature stabilizes.
5. Determine local barometric pressure (mm Hg) and enter this value into the meter.
6. Click "Calibrate". "Calibrate Successful" will be displayed.
7. To retain calibration accuracy between measurements, store with the sensor immersed in water or within a water-saturated air environment such as a sealed storage cup with at least 10 ml of water.
8. It is important to have the water-saturated air and the sensor at the same temperature. Therefore, store a jar of DI in the same environment as the sonde and calibrate in a similar air temperature as the water and sonde.
9. Keep probe out of direct sun or wind.

| DO % Saturation | 98.2 | 100 | 23.9 | |

| POST Field Run CHECK | Meter Reading | Buffer / Cal Std | Temp °C | Comments |
|---|---|---|---|---|
| Conductivity (µS/cm) | 0 | 0 | 22.6 | |
| Conductivity (µS/cm) | 100.9 | 100 | 22.4 | |
| DO % Saturation | 99.7 | 100 | 22.4 | |

**Calibration Procedures:**

**Rinse Multimeter Sonde Between Each Operation**

Rinse 3 times with tap water, 3 times with deionized water, then 3 times with the solution to be used for calibrating or testing.

**Conductivity Calibration Notes:**

1. Dry the conductivity probe with a lab tissue (e.g., KimWipes®) and DI water.
2. Fill calibration cup to within a centimeter of the top of the calibration cup with DI water (0 µS).
3. Fill the calibration cup with 1,000 µS standard so that the temperature/conductivity probe is submerged.
4. Make sure there are no bubbles in the cell; wait 2 minutes.
5. Enter the appropriate standard value (1,000 µS/cm or 1.0 mS/cm) for Sp Cond.
6. Check conductivity using 100 µS/cm standard.

**Dissolved Oxygen Calibration Notes:**

1. Fill the calibration cup with about 1/2 inch of DI; it should be below the sensor cap.
2. Use KimWipes® to dry any droplets from the sensor cap.
3. Invert calibration cup's cap and gently rest it on the cup.
4. Wait 5 minutes, making sure that temperature stabilizes.
5. Determine local barometric pressure (mm Hg) and enter this value into the meter.
6. Click "Calibrate". "Calibrate Successful" will be displayed.
7. To retain calibration accuracy between measurements, store with the sensor immersed in water or within a water-saturated air environment such as a sealed storage cup with at least 10 ml of water.
8. It is important to have the water-saturated air and the sensor at the same temperature. Therefore, store a jar of DI in the same environment as the sonde and calibrate in a similar air temperature as the water and sonde.
9. Keep probe out of direct sun or wind.

# FIELD SAMPLING SHEET - Redmond Paired Watershed Study

Field Personnel: D. Garcia

Sample Date: 9/27/22 Sample Time: 13:10 PDT

Base Flow or Storm Event? Field filtered 5 minutes later: Y / N PST

The lab reanalyzed for TSS past the holding time due to a very low LCS recovery (27%); however, the sample for MONM could not be re-analyze due to insufficient sample volume. All TSS values have provisionally been flagged J for holding time exceedance. The TSS values for MONM may be flagged as R pending the final data validation review and consultation with the QA/QC officer.

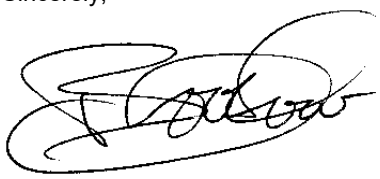
Re: Analytical Data for Project 14-05806-000
Laboratory Reference No. 2210-222



Dear Jess:

Enclosed are the analytical results and associated quality control data for samples submitted on October 21, 2022.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

Blair Goodrow
Project Manager

Enclosures

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: January 26, 2023
Samples Submitted: October 21, 2022
Laboratory Reference: 2210-222
Project: 14-05806-000

**Case Narrative**

Samples were collected on October 21, 2022 and received by the laboratory on October 21, 2022. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Total Suspended Solids SM 2540D Analysis

The Total Suspended Solids sample MONM-2022 (10-222-08) was analyzed on 10-24-22. The Spike Blank was outside of control limits. There was insufficient sample to reanalysis. The other samples were reanalyzed within holding time.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

OnSite Environmental Inc.

**Data Qualifiers and Abbreviations**

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-napthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

N1 - Hydrocarbons in diesel range are impacting lube oil range results.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical _____.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

X1- Sample extract treated with a Sulfuric acid/Silica gel cleanup procedure.

Y - The calibration verification for this analyte exceeded the 20% drift specified in method 8260C, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.

Z -

ND - Not Detected at PQL
PQL - Practical Quantitation Limit
RPD - Relative Percent Difference

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Attention: BLAIR GOODROW

Dear BLAIR GOODROW:

Enclosed please find the analytical data for your REDMOND PAIRED WATERSHED STUDY project.

The following is a cross correlation of client and laboratory identifications for your convenience.

| CLIENT ID | MATRIX | AMTEST ID | TEST |
|---|---|---|---|
| SEIMS-20221021 | Water | 22-A018468 | Micro, NUT |
| QA125-20221021 | Water | 22-A018469 | Micro, NUT |
| COUMO-20221021 | Water | 22-A018470 | Micro, NUT |
| COUMI-20221021 | Water | 22-A018471 | Micro, NUT |
| TOSMO-20221021 | Water | 22-A018472 | Micro, NUT |
| TYLMO-20221021 | Water | 22-A018473 | Micro, NUT |
| TYLMI-20221021 | Water | 22-A018474 | Micro, NUT |
| MONMN-20221021 | Water | 22-A018475 | Micro, NUT |
| MONMS-20221021 | Water | 22-A018476 | Micro, NUT |
| MONM-20221021 | Water | 22-A018477 | Micro, NUT |
| TOSMI-20221021 | Water | 22-A018478 | Micro, NUT |
| SEIMN-20221021 | Water | 22-A018479 | Micro, NUT |

Your samples were received on Monday, October 24, 2022. At the time of receipt, the samples were logged in and properly maintained prior to the subsequent analysis.

The analytical procedures used at AmTest are well documented and are typically derived from the protocols of the EPA, USDA, FDA or the Army Corps of Engineers.

Following the analytical data you will find the Quality Control (QC) results.

Please note that the detection limits that are listed in the body of the report refer to the Practical Quantitation Limits (PQL's), as opposed to the Method Detection Limits (MDL's).

If you should have any questions pertaining to the data package, please feel free to contact me.

Sincerely,

Aaron W. Young
Vice President

# METER CALIBRATION LOG - Redmond Paired Watershed Study

| | |
|---|---|
| Project Number: | 14-05806-000 |
| Personnel Performing Calibration: | D. Garcia |
| Meter: | Pro DSS #2 |
| Date/Time: | 10/21/22 10:11 |
| Barometric Pressure Start of Day: | mmHg: 10:11 Time: 762.2 |
| Barometric Pressure End of Day: | mmHg: 764.6 Time: 13:30 |

| PRE Field Run CALIBRATION | Meter Reading | Buffer / Cal Std | Temp °C | Comments |
|---|---|---|---|---|
| Conductivity (µS/cm) | 3.0 | 0 | 23.7 | |
| Conductivity (µS/cm) * | 1368 | 1,405 ~~1,000~~ | 25.8 | out of 1,000, calibrated using 1413 solution |
| ~~Conductivity (µS/cm)~~ | | 100 | | |
| DO % Saturation | 90.5 | 100 | 23.4 | |

| POST Field Run CHECK | Meter Reading | Buffer / Cal Std | Temp °C | Comments |
|---|---|---|---|---|
| Conductivity (µS/cm) | 1.8 | 0 | 23.1 | |
| Conductivity (µS/cm) | 1408 | 1413 ~~100~~ | 23.6 | |
| DO % Saturation | 100.5 | 100 | 22.9 | |

*Solution has been ordered

**Calibration Procedures:**

**Rinse Multimeter Sonde Between Each Operation**

Rinse 3 times with tap water, 3 times with deionized water, then 3 times with the solution to be used for calibrating or testing.

**Conductivity Calibration Notes:**

1. Dry the conductivity probe with a lab tissue (e.g., KimWipes®) and DI water.
2. Fill calibration cup to within a centimeter of the top of the calibration cup with DI water (0 µS).
3. Fill the calibration cup with 1,000 µS standard so that the temperature/conductivity probe is submerged.
4. Make sure there are no bubbles in the cell; wait 2 minutes.
5. Enter the appropriate standard value (1,000 µS/cm or 1.0 mS/cm) for Sp Cond.
6. Check conductivity using 100 µS/cm standard.

**Dissolved Oxygen Calibration Notes:**

1. Fill the calibration cup with about 1/2 inch of DI; it should be below the sensor cap.
2. Use KimWipes® to dry any droplets from the sensor cap.
3. Invert calibration cup's cap and gently rest it on the cup.
4. Wait 5 minutes, making sure that temperature stabilizes.
5. Determine local barometric pressure (mm Hg) and enter this value into the meter.
6. Click "Calibrate". "Calibrate Successful" will be displayed.
7. To retain calibration accuracy between measurements, store with the sensor immersed in water or within a water-saturated air environment such as a sealed storage cup with at least 10 ml of water.
8. It is important to have the water-saturated air and the sensor at the same temperature. Therefore, store a jar of DI in the same environment as the sonde and calibrate in a similar air temperature as the water and sonde.
9. Keep probe out of direct sun or wind.

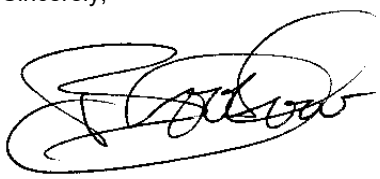
Re: Analytical Data for Project 14-05806-000
Laboratory Reference No. 2211-296



Dear John:

Enclosed are the analytical results and associated quality control data for samples submitted on November 22, 2022.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

Blair Goodrow
Project Manager

Enclosures

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: January 26, 2023
Samples Submitted: November 22, 2022
Laboratory Reference: 2211-296
Project: 14-05806-000

**Case Narrative**

Samples were collected on November 22, 2022 and received by the laboratory on November 22, 2022. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

OnSite Environmental Inc.

**Data Qualifiers and Abbreviations**

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-napthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

N1 - Hydrocarbons in diesel range are impacting lube oil range results.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical _____.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

X1- Sample extract treated with a Sulfuric acid/Silica gel cleanup procedure.

Y - The calibration verification for this analyte exceeded the 20% drift specified in method 8260C, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.

Z -

ND - Not Detected at PQL
PQL - Practical Quantitation Limit
RPD - Relative Percent Difference

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

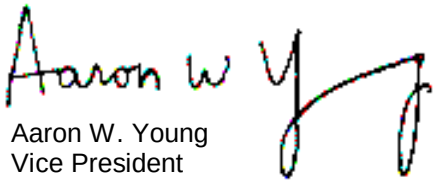
Your samples were received on Tuesday, November 22, 2022. At the time of receipt, the samples were logged in and properly maintained prior to the subsequent analysis.



The analytical procedures used at AmTest are well documented and are typically derived from the protocols of the EPA, USDA, FDA or the Army Corps of Engineers.

Following the analytical data you will find the Quality Control (QC) results.

Please note that the detection limits that are listed in the body of the report refer to the Practical Quantitation Limits (PQL's), as opposed to the Method Detection Limits (MDL's).

If you should have any questions pertaining to the data package, please feel free to contact me.

Sincerely,

Aaron W. Young
Vice President

## ANALYSIS REPORT

On-Site Environmental
14648 NE 95th ST
Redmond, WA 98052
Attention: David Baumeister
Project Name: REDMOND PAIRED WATERSHED STUDY
SDG Number: 2227110
Project #: 14-05806-000
PO Number: 11-296
All results reported on an as received basis.

Date Received: 11/22/22
Date Reported: 12/15/22

---

**AMTEST Identification Number** **22-A020222**
**Client Identification** **COUMO-20221122**
**Sampling Date** **11/22/22, 09:55**

### Results

| PARAMETER | RESULT | UNITS | Q | D.L. | METHOD | ANALYST | DATE |
|---|---|---|---|---|---|---|---|
| Fecal Coliform | 380 | CFU/100 ml | | 10 | SM 9222D | OB | 11/23/22 |
| Total Nitrogen (NOX&TKN) | 1.53 | mg/l | | 0.1 | CALCULATED | | |

**RESUBMISSION 26-JAN-23:** Disregard all previous submissions. Data are reported based on Project Number. All other data remain unchanged.

**Comments:**

1. Data are considered final.
2. Data are not blank corrected. Blank data should be taken into consideration when evaluating sample data.
3. Blank data should be evaluated against specifications using the same blank sample size as the size of the client samples.
4. Percent recovery of labeled compound d5-6PPD-Quinone in the Lab Blank (SGS AXYS ID:WG83742-101) was below the method nominal limit and were flagged with a 'V'. As the isotope dilution method of quantification produces data that are recovery corrected, the variances from the method acceptance criteria are deemed not to affect the quantification of the analytes. Percent labeled compound recoveries are used as a general method performance indicator only.

| COMPOUND | LAB FLAG [1] | CONC. FOUND | REPORTING LIMIT (RL)[2] | RETENTION TIME |
|---|---|---|---|---|
| **6PPD-Quinone** | ND | | 0.100 (L) | |

(1) Where applicable, custom lab flags have been used on this report; ND = not detected at RL.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

# Sample/Cooler Receipt and Acceptance Checklist

Client: HEC

Client Project Name/Number: 14-05806-000

Initiated by: NB

OnSite Project Number: 11-296

Date Initiated: 11/22/22

## 1.0 Cooler Verification

| | | | | | |
|---|---|---|---|---|---|
| 1.1 Were there custody seals on the outside of the cooler? | Yes | (No) | N/A | 1 2 3 4 | |
| 1.2 Were the custody seals intact? | Yes | No | (N/A) | 1 2 3 4 | |
| 1.3 Were the custody seals signed and dated by last custodian? | Yes | No | (N/A) | 1 2 3 4 | |
| 1.4 Were the samples delivered on ice or blue ice? | (Yes) | No | N/A | 1 2 3 4 | |
| 1.5 Were samples received between 0-6 degrees Celsius? | (Yes) | No | N/A | Temperature: | 4.5, 0.5, 2.0 |
| 1.6 Have shipping bills (if any) been attached to the back of this form? | Yes | (N/A) | | | |
| 1.7 How were the samples delivered? | (Client) | Courier | UPS/FedEx | OSE Pickup | Other |

## 2.0 Chain of Custody Verification

| | | | | |
|---|---|---|---|---|
| 2.1 Was a Chain of Custody submitted with the samples? | (Yes) | No | | 1 2 3 4 |
| 2.2 Was the COC legible and written in permanent ink? | (Yes) | No | | 1 2 3 4 |
| 2.3 Have samples been relinquished and accepted by each custodian? | (Yes) | No | | 1 2 3 4 |
| 2.4 Did the sample labels (ID, date, time, preservative) agree with COC? | (Yes) | No | | 1 2 3 4 |
| 2.5 Were all of the samples listed on the COC submitted? | (Yes) | No | | 1 2 3 4 |
| 2.6 Were any of the samples submitted omitted from the COC? | Yes | (No) | | 1 2 3 4 |

## 3.0 Sample Verification

| | | | | |
|---|---|---|---|---|
| 3.1 Were any sample containers broken or compromised? | Yes | (No) | | 1 2 3 4 |
| 3.2 Were any sample labels missing or illegible? | Yes | (No) | | 1 2 3 4 |
| 3.3 Have the correct containers been used for each analysis requested? | (Yes) | No | | 1 2 3 4 |
| 3.4 Have the samples been correctly preserved? | (Yes) | No | N/A | 1 2 3 4 |
| 3.5 Are volatiles samples free from headspace and bubbles greater than 6mm? | Yes | No | (N/A) | 1 2 3 4 |
| 3.6 Is there sufficient sample submitted to perform requested analyses? | (Yes) | No | | 1 2 3 4 |
| 3.7 Have any holding times already expired or will expire in 24 hours? | Yes | (No) | | 1 2 3 4 |
| 3.8 Was method 5035A used? | Yes | No | (N/A) | 1 2 3 4 |
| 3.9 If 5035A was used, which sampling option was used (#1, 2, or 3). | # | | (N/A) | 1 2 3 4 |

## Explain any discrepancies:

1 - Discuss issue in Case Narrative

2 - Process Sample As-is

3 - Client contacted to discuss problem

4 - Sample cannot be analyzed or client does not wish to proceed

# METER CALIBRATION LOG - Redmond Paired Watershed Study

| | | | |
|---|---|---|---|
| Project Number: | 14-05806-000 | | |
| Personnel Performing Calibration: | D. Gardy | | |
| Meter: | YSI ProPSS #1 | | |
| Date/Time: | 11/21/22 | | |
| Barometric Pressure Start of Day: | mmHg: 769.9 | Time: | 17:34 |
| Barometric Pressure End of Day: | mmHg: 763.8 | Time: | 18:00 |

| PRE Field Run CALIBRATION | Meter Reading | Buffer / Cal Std | Temp °C | Comments |
|---|---|---|---|---|
| Conductivity (µS/cm) | 3.8 | 0 | 19.7 | |
| Conductivity (µS/cm) | 990 | 1,000 | 20.7 | |
| Conductivity (µS/cm) | 107.3 | 100 | 20.9 | |
| DO % Saturation | 101.3 | 100 | 20.0 | |

| POST Field Run CHECK | Meter Reading | Buffer / Cal Std | Temp °C | Comments |
|---|---|---|---|---|
| Conductivity (µS/cm) | 1.9 | 0 | 20.8 | |
| Conductivity (µS/cm) | 91.7 | 100 | 22.2 | |
| DO % Saturation | 100.7 | 100 | 21.1 | |

**Calibration Procedures:**

**Rinse Multimeter Sonde Between Each Operation**

Rinse 3 times with tap water, 3 times with deionized water, then 3 times with the solution to be used for calibrating or testing.

**Conductivity Calibration Notes:**

1. Dry the conductivity probe with a lab tissue (e.g., KimWipes®) and DI water.
2. Fill calibration cup to within a centimeter of the top of the calibration cup with DI water (0 µS).
3. Fill the calibration cup with 1,000 µS standard so that the temperature/conductivity probe is submerged.
4. Make sure there are no bubbles in the cell; wait 2 minutes.
5. Enter the appropriate standard value (1,000 µS/cm or 1.0 mS/cm) for Sp Cond.
6. Check conductivity using 100 µS/cm standard.

**Dissolved Oxygen Calibration Notes:**

1. Fill the calibration cup with about 1/2 inch of DI; it should be below the sensor cap.
2. Use KimWipes® to dry any droplets from the sensor cap.
3. Invert calibration cup's cap and gently rest it on the cup.
4. Wait 5 minutes, making sure that temperature stabilizes.
5. Determine local barometric pressure (mm Hg) and enter this value into the meter.
6. Click "Calibrate". "Calibrate Successful" will be displayed.
7. To retain calibration accuracy between measurements, store with the sensor immersed in water or within a water-saturated air environment such as a sealed storage cup with at least 10 ml of water.
8. It is important to have the water-saturated air and the sensor at the same temperature. Therefore, store a jar of DI in the same environment as the sonde and calibrate in a similar air temperature as the water and sonde.
9. Keep probe out of direct sun or wind.

# METER CALIBRATION LOG - Redmond Paired Watershed Study

| | |
|---|---|
| Project Number: | 14-05806-000 |
| Personnel Performing Calibration: | D. Garcia |
| Meter: | Pro DSS #2 |
| Date/Time: | 4/21/22 17:50 |
| Barometric Pressure Start of Day: | mmHg: 769.9 Time: 17:50 |
| Barometric Pressure End of Day: | mmHg: 763.9 Time: 18:00 |

| PRE Field Run CALIBRATION | Meter Reading | Buffer / Cal Std | Temp °C | Comments |
|---|---|---|---|---|
| Conductivity (µS/cm) | 1.9 | 0 | 20.7 | |
| Conductivity (µS/cm) | 963 | 1,000 | 21.6 | |
| Conductivity (µS/cm) | 101.3 | 100 | 21.8 | |
| DO % Saturation | 101.2 | 100 | 21.4 | |

| POST Field Run CHECK | Meter Reading | Buffer / Cal Std | Temp °C | Comments |
|---|---|---|---|---|
| Conductivity (µS/cm) | 1.8 | 0 | [illegible] | 22.2 |
| Conductivity (µS/cm) | 98.4 | 100 | 24.4 | |
| DO % Saturation | 100.1 | 100 | 22.1 | |

**Calibration Procedures:**

**Rinse Multimeter Sonde Between Each Operation**

Rinse 3 times with tap water, 3 times with deionized water, then 3 times with the solution to be used for calibrating or testing.

**Conductivity Calibration Notes:**

1. Dry the conductivity probe with a lab tissue (e.g., KimWipes®) and DI water.
2. Fill calibration cup to within a centimeter of the top of the calibration cup with DI water (0 µS).
3. Fill the calibration cup with 1,000 µS standard so that the temperature/conductivity probe is submerged.
4. Make sure there are no bubbles in the cell; wait 2 minutes.
5. Enter the appropriate standard value (1,000 µS/cm or 1.0 mS/cm) for Sp Cond.
6. Check conductivity using 100 µS/cm standard.

**Dissolved Oxygen Calibration Notes:**

1. Fill the calibration cup with about 1/2 inch of DI; it should be below the sensor cap.

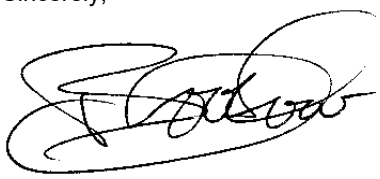
Re: Analytical Data for Project 14-05806-000
Laboratory Reference No. 2211-351



Dear John:

Enclosed are the analytical results and associated quality control data for samples submitted on November 30, 2022.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

Blair Goodrow
Project Manager

Enclosures

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: January 26, 2023
Samples Submitted: November 30, 2022
Laboratory Reference: 2211-351
Project: 14-05806-000

**Case Narrative**

Samples were collected on November 29, 2022 and received by the laboratory on November 30, 2022. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

OnSite Environmental Inc.

**Data Qualifiers and Abbreviations**

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-napthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

N1 - Hydrocarbons in diesel range are impacting lube oil range results.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical _____.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

X1- Sample extract treated with a Sulfuric acid/Silica gel cleanup procedure.

Y - The calibration verification for this analyte exceeded the 20% drift specified in method 8260C, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.

Z -

ND - Not Detected at PQL
PQL - Practical Quantitation Limit
RPD - Relative Percent Difference

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

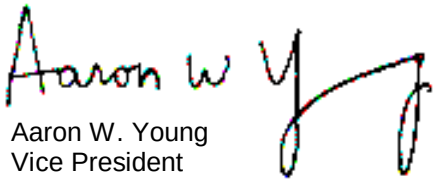
Dear David Baumeister:

Enclosed please find the analytical data for your REDMOND PAIRED WATERSHED STUDY project.

The following is a cross correlation of client and laboratory identifications for your convenience.

| CLIENT ID | MATRIX | AMTEST ID | TEST |
|---|---|---|---|
| COUMO-20221129 | Water | 22-A020638 | Micro, NUT |
| COUMI-20221129 | Water | 22-A020639 | Micro, NUT |
| TOSMO-20221129 | Water | 22-A020640 | Micro, NUT |
| TYLMO-20221129 | Water | 22-A020641 | Micro, NUT |
| MONMN-20221129 | Water | 22-A020642 | Micro, NUT |
| MONMS-20221129 | Water | 22-A020643 | Micro, NUT |
| MONM-20221129 | Water | 22-A020644 | Micro, NUT |
| TOSMI-20221129 | Water | 22-A020645 | Micro, NUT |
| QA127-20221129 | Water | 22-A020646 | Micro, NUT |

Your samples were received on Wednesday, November 30, 2022. At the time of receipt, the samples were logged in and properly maintained prior to the subsequent analysis.



The analytical procedures used at AmTest are well documented and are typically derived from the protocols of the EPA, USDA, FDA or the Army Corps of Engineers.

Following the analytical data you will find the Quality Control (QC) results.

Please note that the detection limits that are listed in the body of the report refer to the Practical Quantitation Limits (PQL's), as opposed to the Method Detection Limits (MDL's).

If you should have any questions pertaining to the data package, please feel free to contact me.

Sincerely,

Aaron W. Young
Vice President

**RESUBMISSION 26-JAN-23:** Disregard all previous submissions. Data are reported based on Project Number. All other data remain unchanged.

**Comments:**

1. Data are considered final.
2. Data are not blank corrected. Blank data should be taken into consideration when evaluating sample data.
3. Blank data should be evaluated against specifications using the same blank sample size as the size of the client samples.
4. Percent recovery of labeled compound d5-6PPD-Quinone in the Lab Blank (SGS AXYS ID:WG83742-101) was below the method nominal limit and were flagged with a 'V'. As the isotope dilution method of quantification produces data that are recovery corrected, the variances from the method acceptance criteria are deemed not to affect the quantification of the analytes. Percent labeled compound recoveries are used as a general method performance indicator only.

| COMPOUND | LAB FLAG [1] | CONC. FOUND | REPORTING LIMIT (RL)[2] | RETENTION TIME |
|---|---|---|---|---|
| **6PPD-Quinone** | ND | | 0.100 (L) | |

(1) Where applicable, custom lab flags have been used on this report; ND = not detected at RL.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.
